ADVANCED FUEL MANAGEMENT ...FROM SMI

The requirements of accurately tanking missiles with propellants is but one of the areas of fuel management in which Servomechanisms, Inc. has demonstrated capability. *Propellant utilization* and *thrust control* are other areas in which SMI has developed highly accurate and precise measuring and control systems.

SMI's LOX Tanking Computer, which has been in production for the past year, accurately measures, controls and indicates the level of liquid oxygen in missile tanks. Loading is accomplished rapidly and accurately due to a unique two-mode control system. The first mode permits extremely high pumping rates until about 98% capacity is reached. The second mode then takes over and controls a precise proportioning valve which adds the necessary LOX to fill the tank within 0.1% accuracy. The second mode also provides continuous topping, thus compensating for LOX evaporation losses during standby.

SMI has currently in development, more advanced fuel management systems to meet the increasingly complex requirements of the next generation of missiles and spacecraft.

SMI would welcome the opportunity to discuss and propose solutions to your fuel management problems. Write for descriptive literature.

Positions are available for qualified engineers and scientists in the areas of:
Systems Synthesis and Analysis—Project Management —Qualification and Environmental Test Engineering—High Vacuum Deposition Techniques.

SERVOMECHANISMS SMI INC.

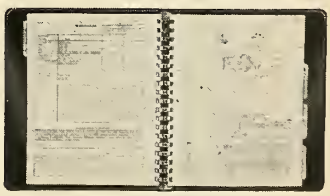
What Valves to Choose for Ground Support Operations?

This Guide Gives You the Facts



If you're a specifier or buyer of valves for missile handling and support systems, this valve specification guide will help you. It provides basic data on valves for handling rocket and missile fuels, liquefied gases and other fluids required at launching pads, testing stations, and operation bases; also on valves for fuel processing and transporting.

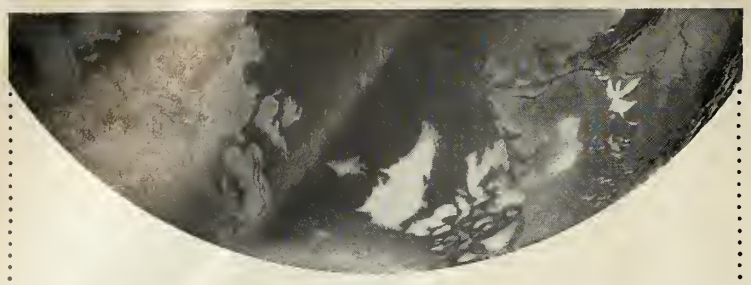
The guide covers gate, globe and check valves, and all data have been condensed into convenient, usable form. You will find it accurate and dependable because it comes from Crane—world's leader in valve engineering.

HOW TO GET YOUR COPY

This guide—"Crane Valves for Rocket and Missile Services"—is yours for the asking. However, because each copy must be registered to its user, please write on your business letterhead. Address the Crane branch nearest you or use the address below.

IT'S CRANE FOR VALVES FOR EVERY SERVICE

Valves for specialized ground support applications are but part of the complete Crane line of dependable, quality valves in bronze, iron and steel for all power, process and utility applications. Consult your Crane Representative for complete information.



CRANE® **VALVES & FITTINGS**

PIPE • PLUMBING • HEATING • AIR CONDITIONING

Since 1855—Crane Co., General Offices: Chicago 5, Ill.—Branches and Wholesalers Serving All Areas

HYDRO-AIRE Division, Burbank, Calif.—Controls for Every Basic Air-Borne System

Look Over the Challenge of Rocket Research in the Fields of

Advanced Propulsion, Experimental Instrumentation, Research Design, Experimental Operations

The men we're looking for should have a good academic background and extensive industrial experience. They should be mature and adept in contact work with our outside vendors. We particularly need men who have the flexible outlook and the quick mind it takes to make design changes in the field.

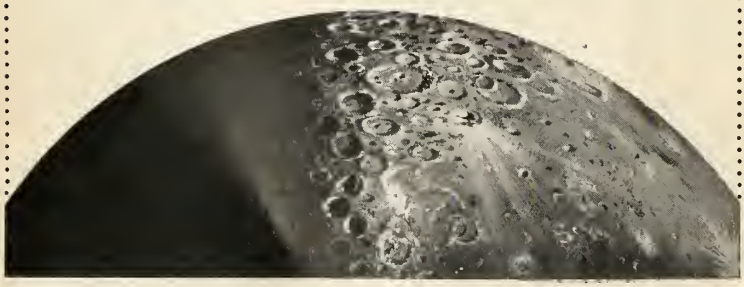
Designers of Specialist Caliber. Extensive experience in the design of mechanical components, using a wide range of materials; capable of stress evaluation, with a general knowledge of heat transfer and fluid flow; good background in electronic control equipment, welding and brazing techniques, metallurgy, and precision machine shop practice.

Senior Research Engineer. Degree in electrical engineering or physics, with an electronics major or equivalent and at least four years of experience in servo design and analysis. His work will include: end-element research; study of design criteria regarding dynamic behavior of rocket engine systems; basic research in control system synthesis methods; investigation of various control methods.

Research Engineer. Degree in electrical engineering or physics, with an electronics major and at least one year in instrumentation or an allied field. He will be a research instrument engineer, responsible for creating complete instrumentation systems to derive theoretical and experimental knowledge from research on statistically tested rocket engines and other combustion devices. His ingenuity will constantly be challenged by such problems as measuring high frequency pressure and flow fluctuations, gas temperatures in excess of 5000° F, and various other parameters—including time, thrust, acceleration, displacement, and gas composition—by spectrographic means.

Rotating and Turbo-Machinery Specialists. These men should be senior research engineers with advanced degrees, no less than five years of experience, and a talent for supervising projects or units of engineers. Their work will involve applied and basic research on aerodynamics and fluid flow problems of advanced rocket engine turbo-machinery.

Senior Research Engineer. MS, ME, or PhD. Must be experienced in flow measurements of unconventional type. His work will involve research and analysis of flow measurements and the dynamics of flow problems.



Instrumentation Engineer. BS, MS, PhD in electrical engineering or physics. His experience should be in developing and using instrumentation on problems directly affecting test programs.

Please write to Mr. D. E. Jamieson, Engineering Personnel Dept., 6633 Canoga Avenue, Canoga Park, California.

COVER: Boeing's *Bomarc-B* will take over much of the U.S. air defense job in competition with Western Electric's *Nikes*, (p. 15)

CREW inspects flotation bag used in recent recovery of AF *Thor-Able* nose cone from the South Atlantic.

RE-ENTRY vehicle is attached to afterbody of the *Discoverer II* prior to successful launch on April 13.

LARGEST titanium head shape ever formed was made by Lukens Steel for Wright Aeronautical Div., Curtiss-Wright Corp.

NAVY launches *Polaris* vehicle from Cape Canaveral April 20 in reportedly successful test of primary flight objectives.

The Golden Field of Missile Support

One of the most critical tasks facing the missile procurement people today is making Congress, the Services, the civilian administrators of the military, and the public realize that the tremendous cost of the program lies not in the missile itself but in its support equipment.

Under that hard stand from which the *Thor* or *Jupiter, Atlas* or *Titan* is launched are miles of pipe, tubes and conduits. Under the stand or in the blockhouse and other shelter units are pumps of all kinds for liquid nitrogen, hydrogen and oxygen. There are pumps for gases, high- and low-presssure valves from a quarter of an inch to two feet in size. There are structural steel and sheet steel, tons of concrete, other tons of reinforcement, instruments of all kinds—sensors, recorders, gauges and computers. There are generators for electrical power, highly-automated check-out equipment, tubes, transistors and dials, trucks and hoists and fork lifts and elevators—and on and on and on.

One *Titan* will cost approximately $2 million. A launching complex for a squadron of nine *Titans* will cost about $45 million. Sites for other missiles can be cheaper. Cost of *Atlas* locations will depend upon the degree of hardening, that is, protection. But multiply the cost of ICBM sites under any reasonable formula and you come up with an entirely new segment of American industry which inevitably will run into billions of dollars.

This fact has not escaped the giants of American industry: big steel, aluminum, the automobile colossi, the big foundries, the heavy equipment people. Said a Pentagon colonel in procurement:

"I was at an official party the other night. One of the top officials of U.S. Steel—not a division man but a top official of the parent company—backed me into a corner and questioned me for fifteen minutes on how to get into the support equipment business."

Many of the big companies now looking over this field find themselves handicapped (unlike the big aircraft firms who have had an eye on it all along) by the lack of technical know-how. They are looking around for smaller companies with technical competence. Object: purchase, merger or simply to work as a team.

The services are looking just as hard for this same competence and particularly for new methods, for many of the construction problems they face involve new problems where new techniques are demanded—at least, new techniques would be welcome.

The *Minuteman,* for instance, will be operational in two to three years—but long before that time the Air Force must have trained crews and prepared sites to receive it. The *Minuteman* is a solid-fuel inter-continental missile with an approximate one megaton warhead. Its site is a hole in the ground—an inverted silo, some 100 feet deep, lined with concrete. Under present plans the *Minuteman* will be manufactured (by Boeing) by the hundreds. And each *Minuteman* means a hole in the ground lined with concrete.

Digging that hole in the ground (multiplied several hundred times) is going to be a pretty expensive business. So is lining it with concrete strong enough to protect it up to, say, 100 psi from a near miss.

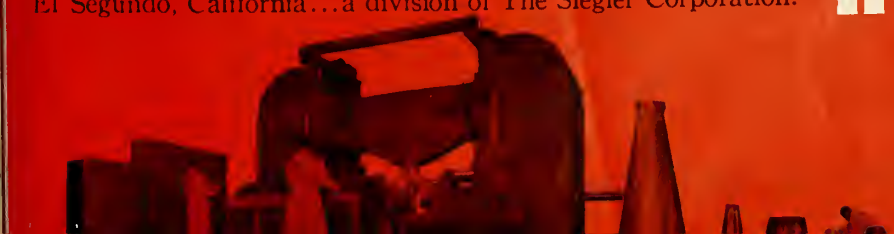
It can be done with present methods, but the military would like to see someone come up with a new method of producing the hole—maybe by drilling, maybe by reducing the earth to liquid and sucking it out. Anyway—just so it is efficient and cheap. Said another Pentagon official:

"The man who can come up with a way to dig a 100-foot hole 20 feet in diameter for $50,000 is going to be digging more damned holes than this country has ever seen. And—mark my words—he won't be a big guy. He'll be a little guy with an idea."

The same thought applies to lining the silo with reinforced concrete. Come up with a new method, a new idea, a way to do it fast and cheaply and there'll be a golden reward.

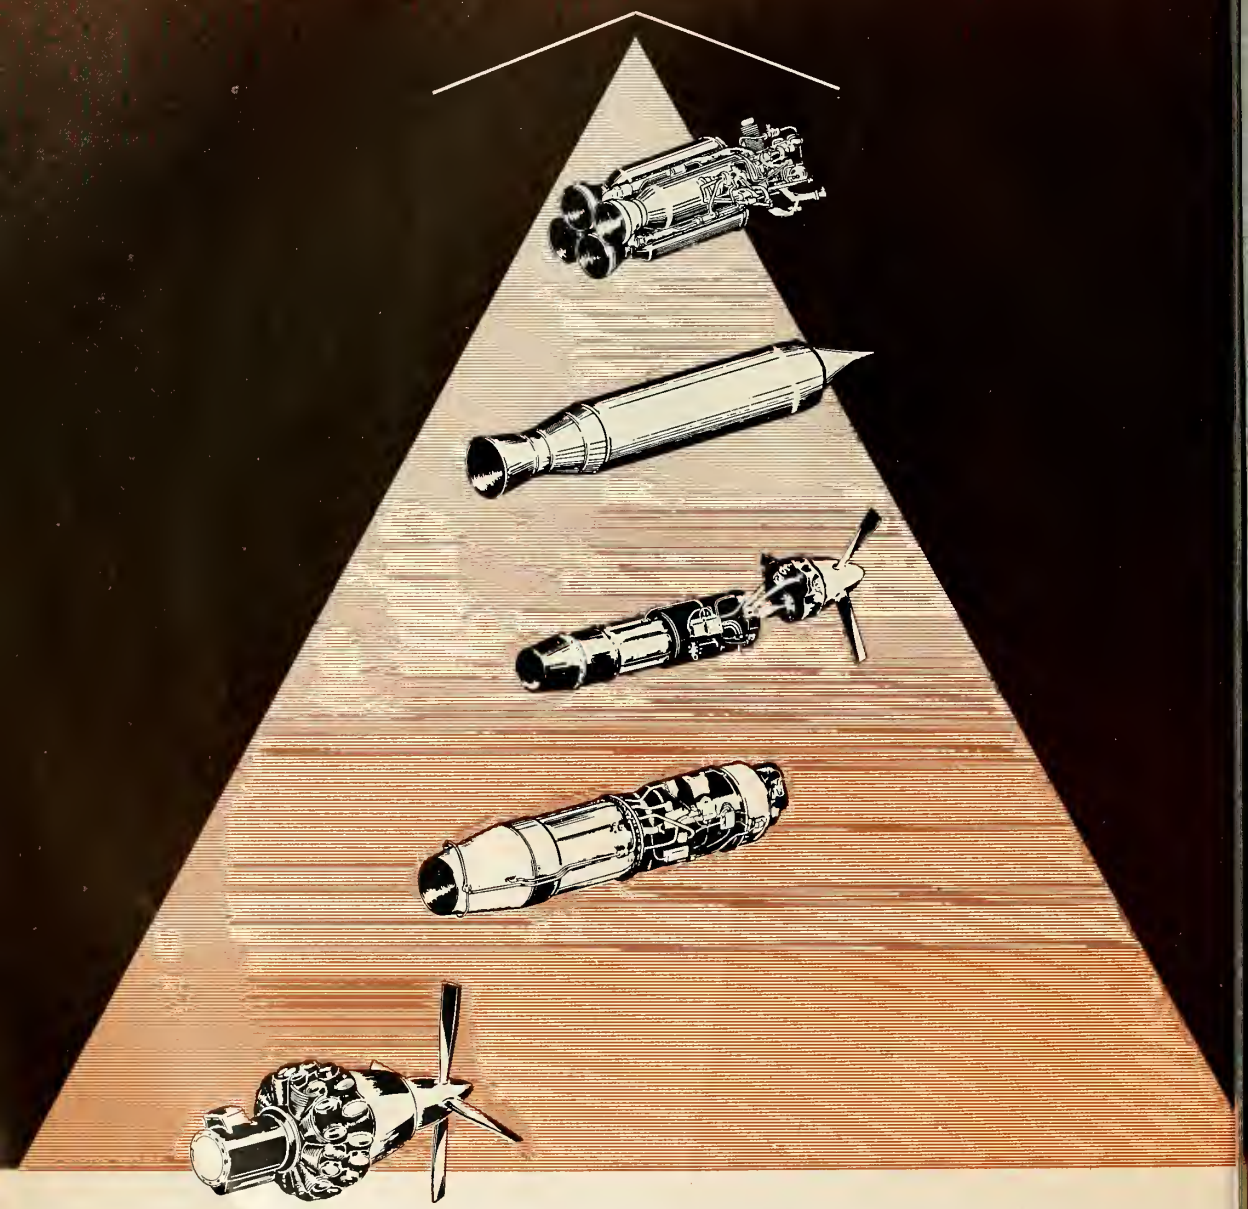
It all adds up to the fact that ballistic missile cost is like the iceberg, four-fifths submerged. The weapon itself will get easier and easier to build as the skills in such spacecraft advance, but there is an equal—and for the moment, greater—need for advanced ingenuity in the parallel field of missile support equipment.

Clarke Newlon



Missiles and Rockets will begin a series of articles shortly relating in detail the problems facing the nation in the building of missile bases, how the giants of industry view those problems and the steps they are taking to deal with them.

SPIN FORGE A MISSILE NOSE CONE IN 7½ MINUTES



Duplicate that nose cone in absolute detail thousands of times and waste no metal. It can be done; but by no other method and by no other machine than a Hufford Spin Forge. These massive, fully automated, precision tools can produce most surface-of-revolution shapes within a tolerance of—.002, up to a diameter of 6 feet, employing hardest metals of varying or constant thickness from .030″ to 1″. A giant step forward to assist you in meeting urgent production requirements, Hufford Spin Forges may be seen performing daily production schedules at the Marquardt Aircraft Utah facility or at our own El Segundo plant. Additional units are currently in design and construction stages. For detailed information, please write The Hufford Corporation, 1700 E. Grand Avenue; El Segundo, California...a division of The Siegler Corporation.

IN THE PENTAGON

ARPA is fighting back to maintain its existence. However, the battle appears to be getting rougher—and more open. Many Pentagon foes of ARPA took heart from the demand by Maj. Gen. Bernard A. Schriever, newly-named Air Force R&D commander, that ARPA be abolished.

• • •

Some experts are betting the best the Navy can hope for in its *Polaris* program is a 1200-mile operational missile by the end of next year. But they say an 800-mile missile is far more likely.

• • •

The Army's satellite detection fence that went into operation in late March is reported to be working perfectly. The fence detected and located the orbit of the *Discoverer II* satellite shortly after it was launched April 13. Informed sources say the fence is capable of detecting any satellite whether or not the satellite is radioing a signal. . . .

• • •

The Air Force has completed a series of pre-contract tests of air-launched ballistic missiles at Cape Canaveral. Award of a contract for an Air Force ALBM is considered imminent.

ON CAPITOL HILL

Congressmen are reading a hair-raising report put out by the House Military Operations Subcommittee. The report—the most authoritative of its kind to date—warns that Russia has a good and steadily improving civil defense system. And it says the better Soviet CD gets the more America's deterrent strategy is undermined. But don't expect Congress to do much about it. The solution would cost billions.

• • •

Watch for a congressional investigation of how much—or how little—about the nation's space programs is being told the bill-footing taxpayers. The House Information Subcommittee can be expected to look into the matter.

• • •

The whole GOP strategy to hold the line on spending hundreds of millions more for ICBM's is being endangered by the White House. The GOP problem: President Eisenhower's insistence that Congress authorize hundreds of millions more for missiles for America's NATO allies. The foreign aid increase—little of it to come in FY 1960—was recommended by the President's own foreign aid advisory committee.

AT NASA

Present schedule for the U.S. man-in-space program is: (1) a short-range flight down the Atlantic Missile range in a *Redstone;* (2) a simple orbital flight in the Project *Mercury* space capsule; (3) an advanced orbital flight in a maneuverable space vehicle; (4) an orbital flight of several days by a maneuverable vehicle manned by seven men; (5) a permanent manned orbiting space lab; (6) a manned flight to the vicinity of the moon; (7) manned landings on and return from the moon; (8) interplanetary flight.

• • •

Systems engineering on the Project *Mercury* vehicle will be done by NASA's Space Task Group and not the Air Force's Space Technology Laboratory as had been reported earlier. STL will be consulted about the *Atlas* booster, but the Space Task Group will do the actual mating of the various components and will recommend to NASA who the subcontractors should be.

AROUND TOWN

Diplomats are speculating on the effect of possible British entry into the East-West space race. The British are considering the possibility of using for satellite launching their new liquid *Blue Streak* missile which is still under development. One reason that some Englishmen are pushing a British space program is to halt the departure of British space experts for America.

• • •

Russia's next bid for leadership in space may not be a manned satellite as many have believed after all. Instead, Russia is reported to have given top priority to launching a spy-in-the-sky satellite—for peaceful purposes, of course.

AEROJET-GENERAL CORP.

THE GENERAL TIRE

A SUBSIDIARY OF THE GENERAL TIRE & RUBBER COMPANY

Engineers, scientists—investigate outstanding opportunities at Aerojet. (Plants at Azusa and near Sacramento, Calif.)

industry countdown

Douglas gets ALBM

Douglas Aircraft Co., Inc., will get the hotly-contested contract for development and prototype production of *WS-138*—the air launched ballistic missile. Air Force selection boards made the decision following a stiff pre-contract competition (Washington Countdown, p. 9). The selection of Douglas was on the desk of Air Force Secretary James Douglas as M/R went to press. The secretary was expected to make the announcement of the contract on his return from a trip away from Washington.

STRUCTURES

To accelerate *White Lance*—an advanced *Bullpup* packing nuclear warhead—Air Force is asking $6.5 million in 1960 FY. Under development by Martin-Orlando, *White Lance* reportedly will have packaged liquid engine by Thiokol. It may also have television-type guidance system, although there are reports this type guidance may be shelved.

• • •

Hypersonic wind tunnel producing speeds up to Mach 10 is being constructed at Army's Aberdeen Proving Ground. New unit is in addition to existing APG Mach 5 installation.

• • •

Expect Chairman Carl Vinson (D-Ga.) of the House Armed Services Committee to muster a strong floor battle for permanent continuation of the Renegotiation Act. Vinson is adamantly opposed to any change in present strict provisions, despite urging of DOD and industry. AIA and EIA say they could live with the law if authority of Renegotiation Board is clipped to keep it from challenging incentive earnings and basic earnings on defense contracts.

• • •

NASA $24 million prime contract for *Delta* launching vehicle goes to Douglas Aircraft Co. With revamped Aerojet-General liquid-fueled first and second stage engines and Allegany Ballistics Laboratory solid third stage, *Delta* is designed to put 250-pound payload in 300-mile orbit or send 110-pound payload on deep space probe in 1960-61.

Nuclear-powered carrier Lexington is deploying to Atlantic fleet with the first operational squadron of aircraft armed with the air-to-surface *Bullpup*. FJ-4B's and VA-212's can each carry five of the 540-pound missiles.

PROPULSION

With the Army, Wyandotte Chemical has developed new solid propellant L-1, said to have 10% to 15% better performance rating than existing solids and a specific impulse of 260+. Composition is nitroglycerine, nitrocellulose, polyurethane, ammonium perchlorate, aluminum, magnesium oxide and 2-nitrodiphenylamine.

• • •

Behind AEC's abrupt start-and-stop buying of quantities of lithium and lithium compounds, principally from Foote Mineral Corp. and the Lithium Corp. of America, is this explanation: AEC was using lithium hydroxide in cooling loops of *Kiwi* reactors—and suddenly shifted back to sodium hydroxide when it couldn't lick the corrosion problem.

ELECTRONICS

Present concepts of radio propagation may be revised on the basis of Ohio State University's measurements of *Sputnik III* signals, which indicate ionosphere depth of thousands of miles. If electron density diminishes at such a low rate with distance outward from the earth, as researchers have concluded, then ionoscatter path lengths may be increased significantly. DOD and NATO may find itself with a surplus of its newly-established ionospheric scatter mode stations around the globe.

• • •

Breadbox to sugar cube size reduction is visualized in Westinghouse breakthrough in growing germanium crystals as thin, flat ribbons for miniaturized electronic space vehicle equipment. ARDC has awarded the company a $2 million contract for further molecular electronic development.

ASTROPHYSICS

New theory has been proposed by Dr. Harold C. Urey that the moon may have molten interior with erupting volcanoes giving off gas and changing its exterior surface. The theory gives support to Russian observations, previously greeted with skepticism, of gaseous eruption from the lunar Crater of Alphonse.

CRYOGENICS
in the Space Age

CRYOPUMPING
and the problems of space travel

To simulate the conditions on the fringes of the Earth's atmosphere, engineers must produce ultra-high vacuums (10^{-8}mm Hg or greater) and cryogenic temperatures approaching absolute zero (−459.69°F). Such conditions, until recently, were laboratory curiosities produced on a limited scale.

Today, by using *cryopumping*, large hypersimulation chambers can be designed and built to test both men and equipment under these extreme conditions.

Cryopumping involves freezing out the atmosphere in a chamber to create both the ultra-high vacuums and the cryogenic temperatures required. Although its principle has long been known, only recently was *cryopumping* developed for practical, large-scale use by the University of Southern California Engineering Center and Arthur D. Little, Inc.

The special ADL refrigerating unit used in USC's new hypersonic, low-density wind tunnel can *cryopump* more than 4 million cubic feet of nitrogen per minute at 10^{-4}mm Hg; at lower pressures, this pumping rate increases. It uses only 50 horsepower. Conventional vacuum pumping would require 500,000 horsepower!

MAGAZINE OF WORLD ASTRONAUTICS

Strategic Ready Reserve Studied

Contractual personnel would maintain and operate complex weapon systems even in tactical use under proposed plans

by Donald E. Perry

WASHINGTON—Top Defense planners are seriously studying highly classified missile industry proposals which, among other things, would involve creation of what may be known as a Strategic Ready Reserve of trained and experienced contractual personnel to substitute for uniformed servicemen in firing complex missile hardware in event of war.

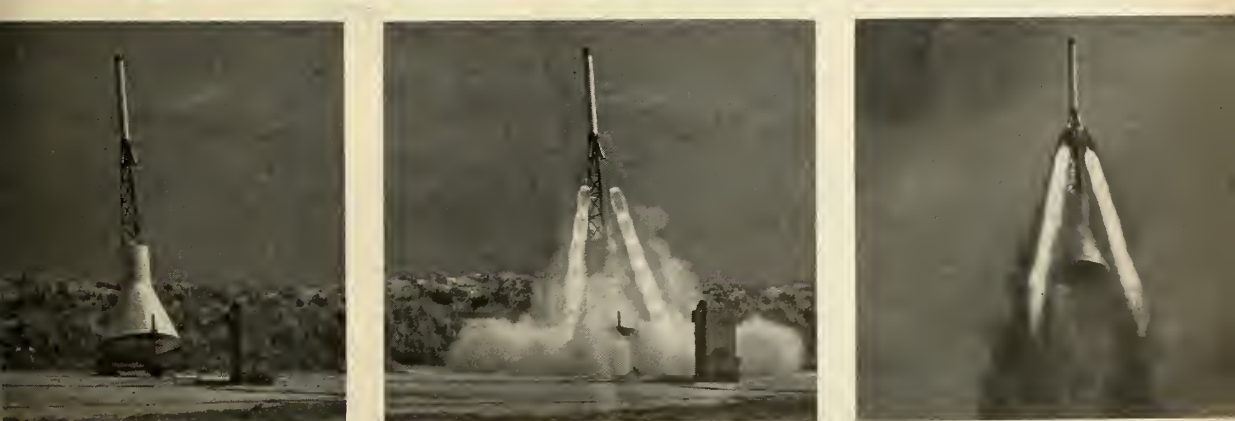
At least three prime weapon system contractors have submitted views which are being studied by the Joint Chiefs of Staff, Pentagon manpower utilization branches and the war colleges of the principal services, M/R has learned.

If a decision were made for retaliatory "button pushing," contractual personnel would immediately become military personnel subject to current Armed Forces regulations. The military-missile forces conceivably could be reduced to a skeleton force of technologically competent career officers.

An ultimate goal in the proposals is future weapon systems contracts including tactical staffing and operation in addition to design, development, manufacturing and testing.

All but the first are now done by weapon system prime contractors, many of whom feel that if war comes tomorrow contractor personnel will have to do the firing because of lack of sufficiently trained service personnel.

The dollar volume of prime contracts would swell to super-high figures, but on the other hand, industry spokesmen have told M/R, standing Armed Forces, their training and subsistence would be reduced far below the present 1.5 million manpower figure.



• **The problems**—Defense planners are seriously worried about the ability of military personnel to maintain and operate complex weapon systems. Training costs of service personnel climb to astronomical new highs each year. Coupled with this is the problem of service personnel turnover. After costly expenditures for training, servicemen join the ranks of industry when they are trained and experienced, thus depriving the military of their services at a time of maximum usefulness.

Another problem area is mobilization of reserve forces. Planners are ruling out any quick mobilization during all-out missile warfare. The time factor will not permit recruitment and training in complex weaponry or transport to aggressive warfare stations and duties. One proposal for utilization of manpower in reserve programs would be assignment to minor defensive roles and responsibilities and to take over duties presently vested in the virtually ineffective Civil Defense organization.

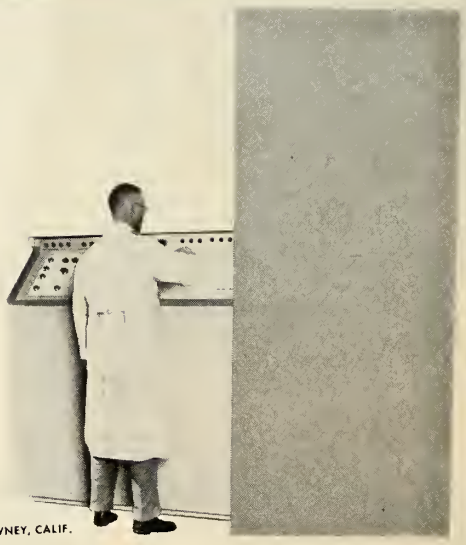
These reserve forces would thus be used in a point defense concept with the Strategic Ready Reserve force manning critical posts.

• **When will it come?**—Industry spokesmen believe that the first test of the Strategic Ready Reserve Force could come in the fleet ballistic missile program. The Navy is quietly wondering whether service personnel can be trained—and retained—with the technological qualifications to operate and service the hardware and support equipment necessary for instant retaliation.

MERCURY CAPSULE TESTS AT WALLOPS ISLAND

ESCAPE MECHANISM of the Project *Mercury* manned orbital capsule is tested at NASA's Pilotless Research Station at Wallops Island, Va. Mechanism is in the tripod arrangement on full-scale model weighing about one ton. Escape rockets lifted the capsule to 2250 feet where the tripod was ejected and a parachute lowered the capsule to the water where it was recovered by helicopter.

It's great to be proud of the place you work



What makes a successful engineer?

Initiative—experience—imagination—intelligence are all important factors. But there is at least one more—enthusiasm.

Young engineers at Autonetics are *enthusiastic*. They're fired up about the projects they work on, such as the advanced inertial-navigation systems for the Polaris-carrying subs, and the guidance and control system for the Minuteman missile.

Variety sparks their enthusiasm. Autonetics' young men also designed RECOMP II, a general purpose, all-transistor, digital computer; NUMILL, a completely automatic, machine tool control system; BACE, high-speed automatic checkout equipment; and many other industrial and military products.

Today at Autonetics there is room for engineers and scientists who seek unusual creative problems in electronics and electromechanics. Please send your resume to Mr. N. E. Benning, 9150 East Imperial Highway, Downey, California.

Autonetics A DIVISION OF NORTH AMERICAN AVIATION, INC., DOWNEY, CALIF.

INERTIAL NAVIGATION / ARMAMENT CONTROL / FLIGHT CONTROL / COMPUTERS AND DATA PROCESSING

Among the achievements of Autonetics' young men: The first successful airborne all-inertial navigation system . . . first navigation system accurate enough to guide the USS Nautilus and Skate on their historic voyages beneath the Arctic ice . . . first successful automatic star tracking by an inertial navigation system during daylight flight . . . first inertially stabilized gyro platform proved operable in any kind of maneuver . . . first successful completely automatic landing system for supersonic missiles and aircraft . . . first transistorized portable digital computer with "big computer" capabilities.

COVER STORY:

Bomarc Will Soon Move into U.S. Air Defense Role

Boeing surface-to-air missile goes to first base this fall, may displace Nikes

by James Baar

WASHINGTON—The Era of the *Bomarc* is almost at hand.

In less than six months the first base for the Boeing surface-to-air missile is scheduled to be opened at McGuire AFB, N.J.

At any time now the first greatly-improved *Bomarc-B* will streak from Cape Canaveral where the new model will begin undergoing flight tests.

Within the next year to two years squadrons of nuclear warhead-packing *Bomarcs* will be stationed across the nation at from seven to 14 air defense bases—most probably more.

The first two will be equipped with the more than 200-mile range *Bomarc-A*. The rest will be equipped with the more than 400-mile range *Bomarc-B*.

• **Air Force vs. Army**—The final number of bases to be set up hangs on the outcome of the bitter competition between the Air Force's *Bomarc* and the Army's Western Electric *Nike-Hercules*.

Gen. Thomas D. White, Air Force chief of staff, has said 40 *Bomarc* bases could protect the entire country from attack by manned aircraft.

The first two *Bomarc* bases are expected to have 60 launchers. The rest are expected to have about 30.

Bomarc-B's at any one base will be able to hit targets within a half-million square mile area. The entire area of the United States is about 3 million square miles.

However, any *Bomarc* base-building program of such magnitude would be certain to mean the end of the *Nike-Hercules* program. And, at least at present, nothing of the sort is being planned by the Defense Department.

• **Defense in depth**—Defense Secretary Neil H. McElroy told Congress only recently that both weapon systems are needed: the 75-mile range *Nike-Hercules* for point defense; the much longer range *Bomarc* for area defense.

McElroy said the *Nikes* and *Bomarcs* used in combination with manned interceptors provide the nation with "defense in depth."

Richard E. Horner, Assistant Air Force Secretary, said the *Bomarc* could be used to do "the *Nike* job." But he said it "would not give its greatest defense capability per dollar in that kind of task."

However, a recently completed report by former Assistant Defense Secretary Louis Furnas gave the *Bomarc* an enthusiastic boost. The result is expected to be a speed-up in the program —including the release of more funds for base construction and possibly the naming of three more base sites.

• **Bases to date**—At present a total of 14 base sites have been chosen. The first four and the order in which they are scheduled to be completed are: McGuire; Suffolk County AFB, N.Y.; Otis AFB, Mass.; and Dow AFB, Maine.

The 10 others chosen are: Langley AFB, Va.; Kinross AFB, Mich.; Niagara Falls Municipal Airport, N.Y.; Truax Field, Wis.; Duluth Municipal Airport, Minn.; Paine AFB, Wash.; Camp Adair, Oregon; Travis AFB, Calif.; Vandenberg AFB, Calif.; Ethan Allen AFB, Vt. But of the last 10 funds have been released only for Langley, Kinross and Duluth.

By the end of next month the Army is scheduled to have 62 battalions of *Nikes*—both the 35-mile *Ajax* and the *Hercules*—protecting key targets around the country.

• **Ten-year program**—The *Bomarc* program dates back to 1949. The first production unit of the *Bomarc-A* was completed in December, 1957.

The *Bomarc-A* is powered by an Aerojet-General liquid rocket and two Marquardt Aircraft ramjet engines. The *Bomarc-B* is powered by a Thiokol solid propellant rocket and improved Marquardt ramjets.

Both models travel at speeds greater than Mach 2.5. Both fly at altitudes of about 70,000 feet.

The appearance of both models is the same. They are 47 feet long, have an 18-foot wing span and weigh about 15,000 pounds.

More than a year ago much more advanced "C" and "D" models were contemplated by Boeing, but the plans were scrapped on grounds that they were not feasible.

• **Guide and Guided**—The *Bomarc* is integrated with the IBM-SAGE computer system which is used to fire the missile and guide it to the vicinity of its target. The computer then releases control and the missile's target-seeker homes on the target.

No actual collision is necessary. The *Bomarc* is armed with a proximity fuse.

A test *Bomarc-A* has been launched from Cape Canaveral by a SAGE computer 1500 miles away at Kingston, N.Y., and successfully guided to its target.

Bomarc-A's also have been fired in salvos at different targets from the Air-Proving Ground at Eglin AFB, Fla.

The *Bomarc-B's* are scheduled to be tested for about a month at Cape Canaveral. Then the testing will be switched to Eglin. The Air Force anticipates little difficulty.

The Story Behin

THE DEATH OF A MISSILE

One of 40,000 parts fails and a 75-foot bird of space blows up to end a rare association between man and machine—as photographed exclusively for Missiles and Rockets by Cornell Capa

by Erica M. Karr

A two-inch newspaper story, datelined Edwards Air Force Base, March 27, gave this explanation of the explosion opposite: *A captive Atlas missile exploded on its test stand here today. There were no casualties. The same Atlas—Model 60—had completed numerous other test firings at the base. The missile was destroyed. Cause of the accident was not disclosed. The missile had performed most of its test objectives when the accident occurred.*

Story behind this story developed in the blockhouse where famed photographer Cornell Capa was set up to snap "the new breed of young white-collared engineers" who build on man's space hopes. The "routine test," after two days of false starts, had ended in the worst ground disaster ever suffered by an *Atlas*, and the new breed of men, after months of working closely with their massive steel bird, suffered with it. Capa catches the spirit of the blockhouse story from the first "pep talk" briefing, through the moment when the deafening explosion shook the ground and blew up $2-million worth of missile.

At first the Air Force reported only that "nothing fundamental or systematic" was involved in the blow-up but—as later pieced together from Air Force and other sources—the complete story is both human and dramatic.

The captive test firing was first attempted on March 26 after completion of prefiring preparations. This try was called off when electrical difficulties were encountered in the propellant system and traced to "excessive moisture in an electrical connector." The connector was replaced and countdown operations for the firing started at 10:55 the next morning. All went well until T-minus 55 minutes when a hold was called to check the booster engine's auto pilot null position. All clear again, and the count was recycled to T-minus 60 minutes and continued without further difficulty.

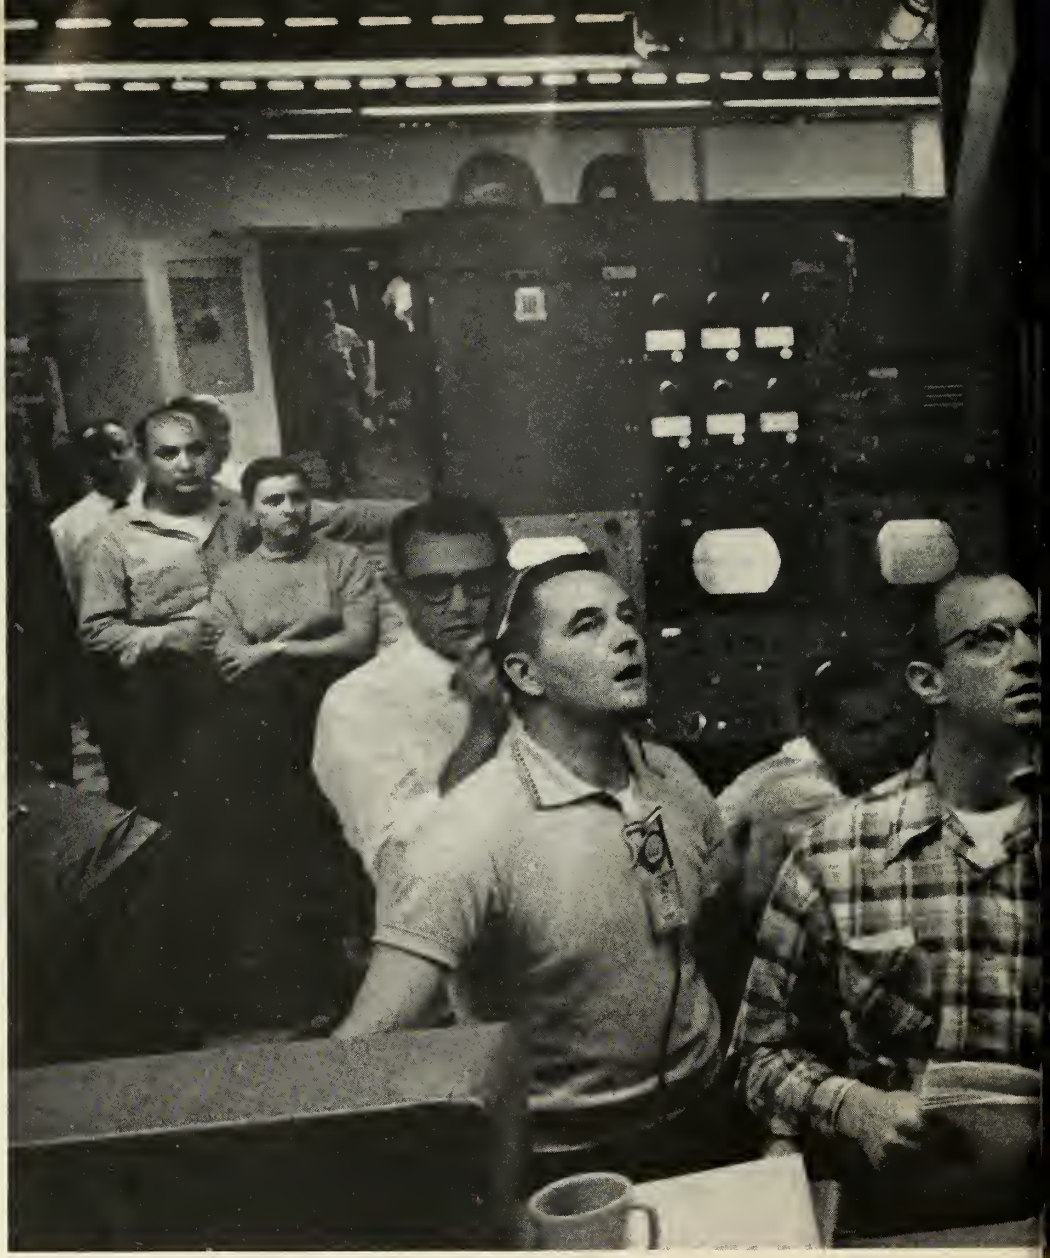
At 1:35 p.m.—T-minus O—a normal engine start and the transition to main stage operation were achieved. Then one of the tubes in the "spaghetti" tube network of the engine cracked, spewing out a small stream of fuel, and causing a fire followed by a small explosion in the engine's thrust section. This was recorded at 43 seconds. At 54 seconds, a larger explosion and fire destroyed the missile.

"Disabling of equipment and controls," resulting from initial explosion, was given by the Air Force as the cause of the final explosion. It was later reported by other sources that the sensor for the ground pressurization system had stopped indicating, allowing an excess of pressure to build up.

Air Force ended its report with this statement:

(*Continued on page* 20)

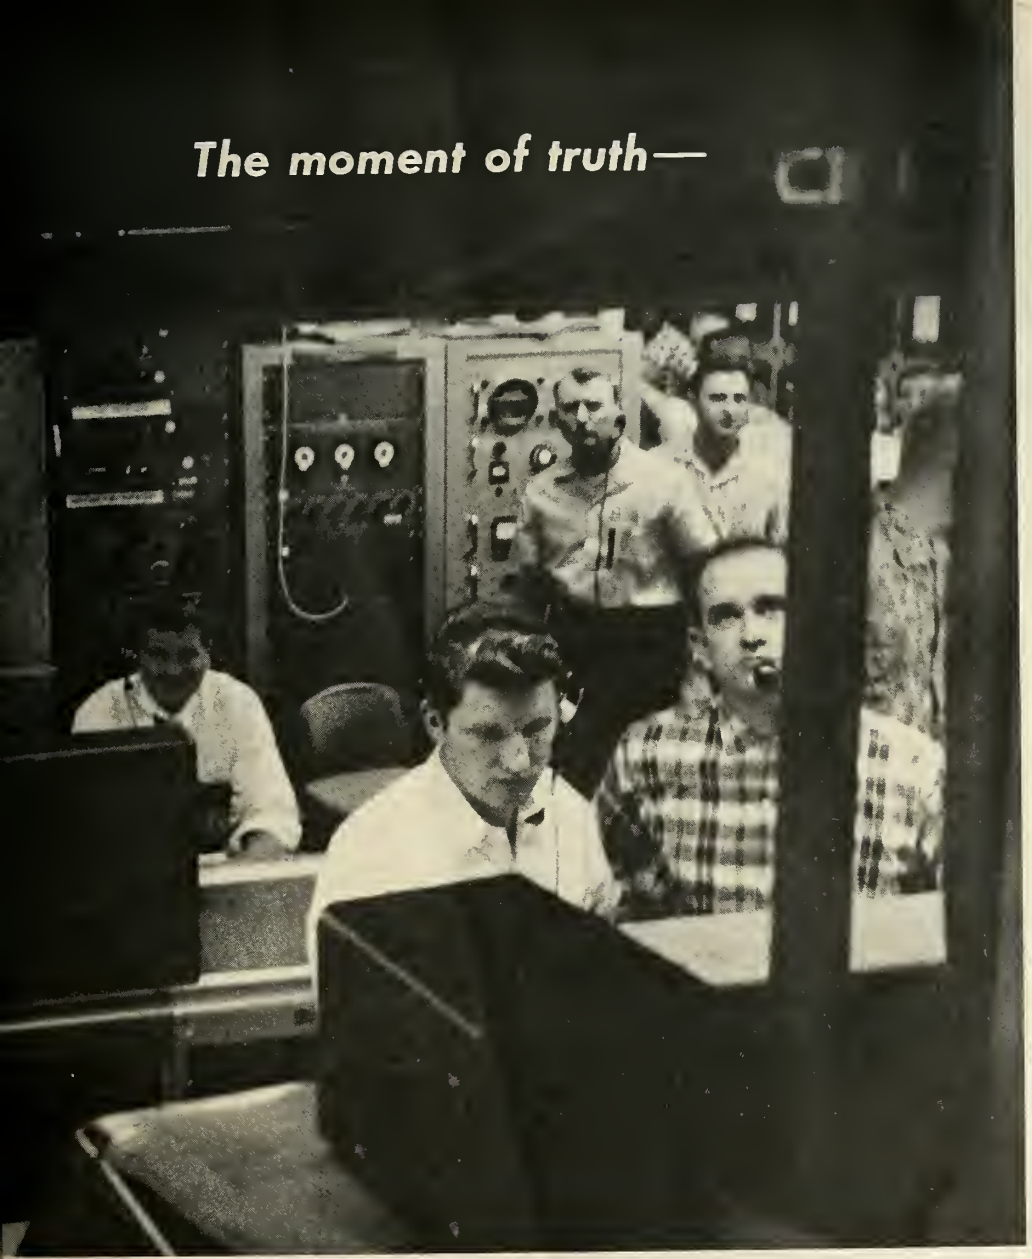
PRE-TEST BRIEFING has air of a before-the-game pep talk as all hands get a run-through on aims, roles, timing and a bid for close cooperation.



YOUNG MEN with big decisions. A new industry gives birth to a new breed of crew-cut, white-collared, creative engineers to man the drawing boards, run the checkout and countdown consoles, decide whether or not to call off, and later to analyze test results.

SORRY SQUATTERS get word that electrical d ties in propellant system will hold up test. Next d was delayed again to check booster engine's null po

BAD NEWS at 1:35 p.m. explosion, recorded on the television monitors is reflected in the faces of the blockhouse crew as the reality of the catastrophe sinks in.



"Because of elaborate safety precautions, no personnel were injured and damage was confined to the test stand and superstructure and nearby ground support equipment."

Questioned after the explosion, spokesmen at Convair Division, General Dynamics Corp., where the missile is under production, said the *Atlas* had undergone "hundreds" of such tests and that this was the first time one had exploded on the ground. "We've been real lucky for quite a while on engines," a spokesman said. "When you're dealing with thousands of parts (more than 40,000 not counting subsystems), any one of these can fail. But that's what the tests are for—to find any weak spots."

He pointed out that in *Atlas* tests the same failure has never shown up more than twice. "By the third run, we have always had that particular bug licked."

A top Convair official expressed "high confidence" in *Atlas'* reliability. "The *V-2* achieved 80% reliability out of 4000 flights," he said. "I have no doubt we will achieve at least this. We are awfully close to that now and this is still a development program."

The moment of truth—

Reason why failure of one missile part can end in such a major catastrophe is the amount of energy involved. An *Atlas* burns in 15 seconds about the same amount of fuel as that of a DC-7 on an entire cross-country trip.

While the explosion rocked the countryside it also rocked the men in the blockhouse. Even more than the representatives of Convair; Rocketdyne, which builds the *Atlas* engine; the Air Force's Ballistic Missile Division, and Space Technology Laboratories, the technical men who had worked closely over a period of many months were visibly affected. Said one: "I knew every pore of that bird."

That theirs is not "just another job" is quickly evident to the blockhouse observer. The challenging needs of the new space field have given rise to a new type of technician and engineer determined to meet them. Sporting crew cuts, white collars, bow ties and a sense of purpose and dedication, many of them live with their jobs 24 hours a day. Some admit waking up out of a sound sleep to ponder a problem. Others dream about them. Emotional involvement with their machines is common among them and when one fails there is a sense of personal

CAPT. DAVID FRAZER, BMD representative, and Donald Fagan of Convair confer with fire marshal.

disappointment. When one disintegrates before their eyes, as in this case, it is taken like the passing of an old friend.

A rare team spirit pervades the blockhouse. It is keenly felt first during the pre-test briefings, when all hands, including the outside crewmen, are given a run-through in an atmosphere of a before-the-game pep talk. Every eye is riveted on the test conductor as he explains aim of the test, timing, roles and asks for a perfect record with everybody giving it everything he has: "Your full cooperation and attention is essential."

It would be in keeping with the tenor of the scene if he wound up the meeting with the rousing admonition: "Our team must win!"

In this *Atlas* test things moved like, and by, clockwork until the first delay, then picked up again until the second holdoff broke the tension. As the countdown started again, from a relaxed beginning, the technicians were soon busy again directing their full attention to the job at hand.

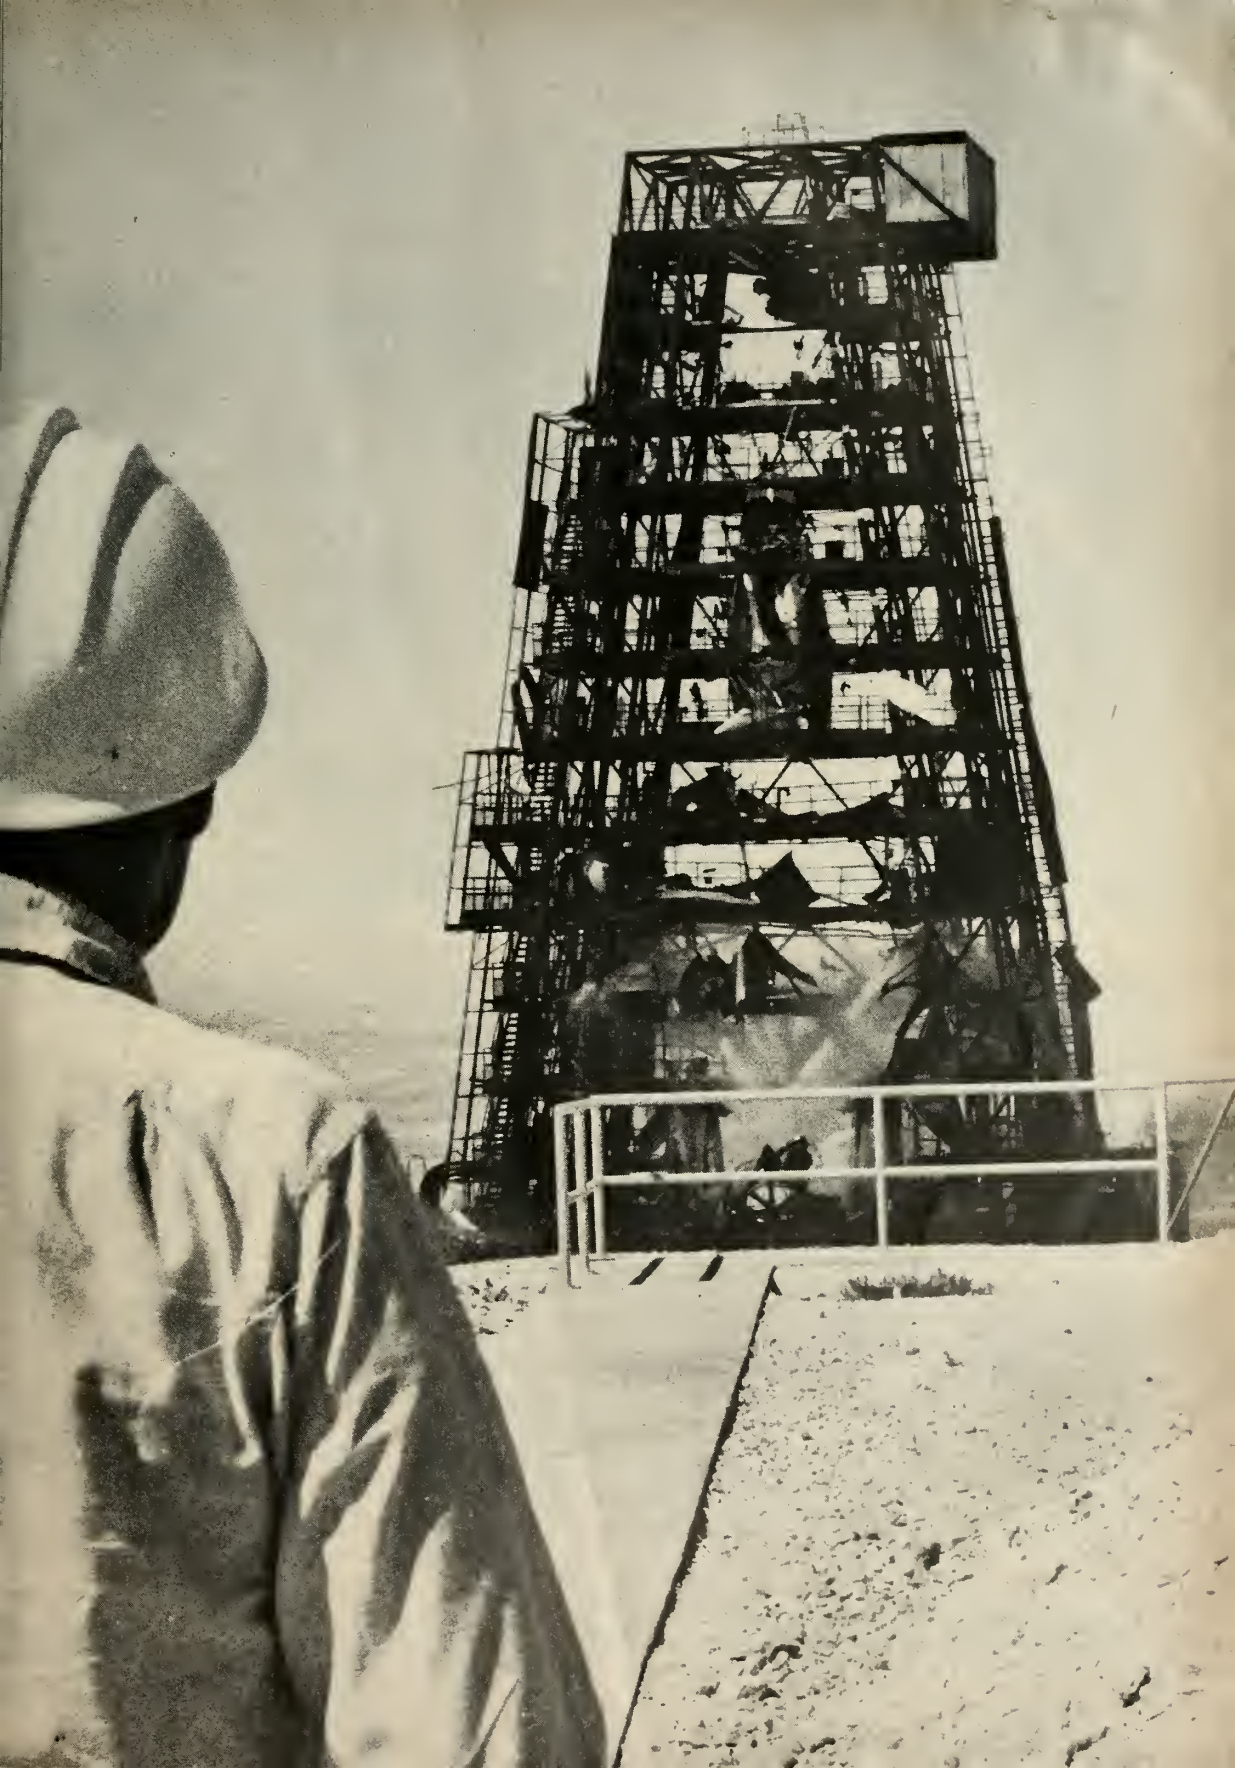
NOTHING LEFT but the beak of the bird in its nest. Ground crew man takes last look. Another will one day lift the first U.S. manned capsule spac

At T-O, all eyes were on the television monitor.

First reaction, as the moment of truth hit, was one of complete disbelief, then reluctant recognition followed by speculation on the cause of the explosion. The fire marshal gave assurances that no one was hurt and the job of gathering up the yards of recording paper that charted each minute phase of the operation was begun.

Last to leave the blockhouse was test conductor Donald Fagan of Convair. The men filed out leaving him slumped behind his console and went to take a last look at the smoking and torn hulk of what was left of their once proud space machine.

Atlas has now undergone 23 test flights. Out of the last 14, which had complete systems, nine were reported to have been completely successful with four of the 14 recorded from 25% to 90% successful.

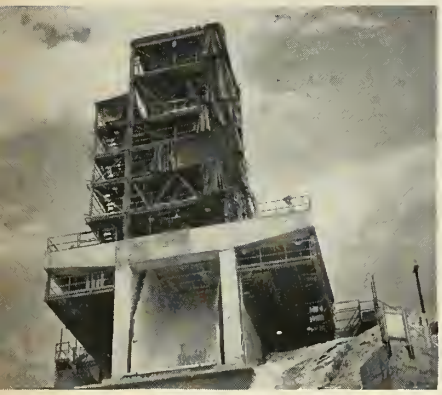


An *Atlas* powered by Rocketdyne engines will lift the first U.S. manned space capsule, *Mercury,* under contract from the National Aeronautics and Space Administration.

Atlas fabrication began in San Diego in 1955 with first engine tests run at Edwards in June 1956. Completed missiles were delivered to Sycamore and Cape Canaveral that fall.

Convair's associate contractors, in addition to Rocketdyne, include General Electric Co. and the Burroughs Corp., radio-inertial guidance (to be followed by American Bosch Arma Corp., all-inertial guidance), General Electric Co. and Avco, nose cone; and Sundstrand Turbo Division (formerly American Machine and Foundry), airborne accessory power supply.

EPITAPH for a missile is written on yards of recording paper which closely charted each test step.



(left) Navy Polaris AX-1 flight test vehicle at beginning of launch. Lockheed's Polaris fleet ballistic missile is more than a year ahead of original schedule.

(below left) One of the Santa Cruz test stands with dynamic thrust mount to simulate flight environment. Vibration oscillator functions during static firings.

(below right) Large centrifuge for environmental testing has unique shaker attachment to provide vibration simultaneously with high G-loadings.

TEST / Expanding the Frontiers of Space Technology

Testing is a vital part of every stage in the development of missile and space programs at Lockheed Missiles and Space Division.

The Division maintains one of the most completely equipped missile and space test laboratories in the world. Equipment includes: altitude, temperature and humidity chambers; shaker and vibration systems; G-accelerators; and apparatus capable of performing chemical, metallurgical, plastic, heat transfer, hydraulic, pneumatic, shock, acceleration, sinusoidal and random vibration, structural, electrical, and electronic tests. Static field testing; research and development testing on controls; testing in ordnance and hydraulics and high-pressure gas and propulsion systems are conducted at the 4,000 acre, company-owned test base in the Ben Lomond mountains near Santa Cruz, California.

Flight testing is conducted at Cape Canaveral, Florida; Alamogordo, New Mexico; and Vandenberg AFB near Santa Maria, California; in a unique manner. All components and sub-systems of a new project are initially tested on known-performance, production missiles. Thus, when the final system is ready for first flight, its individual components already have flight-tested reliability. This new concept of flight testing has enabled Lockheed to produce extremely complex missile systems in record time and at greatly reduced expense.

Underwater launch tests—including studies of cavitation, wave simulation and skip motion—are carried on at the Sunnyvale facility and at the Navy test base on San Clemente Island. In addition, structural and other tests are performed at Hunter's Point Naval Shipyard, California.

If you are experienced in any of the various phases of testing, we invite your inquiry. Positions also are available in physics, mathematics, chemistry, or one of the engineering sciences. Write: Research and Development Staff, Dept. E-29, 962 W. El Camino Real, Sunnyvale, California. U.S. Citizenship required.

"The organization that contributed most in the past year to the advancement of the art of missiles and astronautics." NATIONAL MISSILE INDUSTRY CONFERENCE AWARD

How Far to Go with Redundancy?

Duplication seems to be on the increase in industry, but many experts call for limits on the expensive and risky practice

by Charles D. LaFond

WASHINGTON—Many design engineers are questioning the wisdom of unrestrained or unnecessary use of circuit and equipment redundancy. It is admitted that by careful investigation and analysis, weak spots in an electronic system can be predicted and should be strengthened or compensated for. But how far should this be permitted to go?

Is it better for the design engineer to duplicate relatively high-fail-potential equipment or circuit elements without limit—or should more time and effort be spent in creating better circuit design with more reliable and longer-lived components? This is not meant to imply that redundant configurations should not be used, but that their use should not be the excuse for avoiding the betterment of conventional circuits.

The use of redundant circuitry for achieving higher equipment reliability appears to be on the increase. Just how much industry is using it at present is not known, but certainly a great deal of time, effort, and money is being spent in studying the feasibility of duplicating equipment and circuits in electronic systems.

The requirement for redundancy is based on the sometime need for systems in which no single component failure can be permitted to cause a system failure or even severe performance degradation.

For those not too familiar with the term, there are several kinds of redundancy:

• Parallel-redundancy involves the use of two (or more) identical units or "chains" of equipment. If a unit fails, its counterpart still provides adequate performance. With proper design, some of the unit pairs produce an additive output; that is, together they achieve a higher-than-minimum performance.

• This same system, employing parallel-redundancy, may have some units that cannot be operated together. Here, standby-redundancy can be employed. The duplicate equipments are connected in such a manner that one is in operation while the other is a "hot" operating spare, or standby. Some type of failure-detector switching device is included for control.

• Circuit-redundancy is an internal type of duplication. As a result of careful analysis during developmental stages of an equipment, the failure probability of some subsystem circuitry may be determined to be too high. To correct this, an additional circuit is added (where possible) for each weak link. Necessary relay or switching circuitry must be included also.

Since redundancy is a method for improving reliability, the latter should be explained. Reliability can be defined as the probability of a unit performing its function as designed for a minimum time period and under given operational environments.

• **Past use**—Parallel and dual back-up equipments have been employed successfully—albeit expensively—for many years. Commercially, the radio and television industry has utilized extensively the philosophy of operating standby systems. Equipment and maintenance costs are far outweighed by the potential losses in advertising money and audience in case of station failure or rapid transmission degradation. The military currently is a principal advocate of this concept for obvious reasons.

Because equipment reliability is

Antennas for BMEWS

GIANT RADAR tracking antennas are being built by Goodyear Aircraft for the Air Force BMEWS installation. Mounted on 30-foot pedestals in 140-foot diameter radomes, the antennas are among the largest ever made. They will provide a radar fence in the Far North to detect and track enemy ICBM's as they appear above the horizon.

The work is being done by Goodyear under a multi-million-dollar contract with RCA, system prime contractor. Air Force AMC has primary responsibility for the project.

not always high enough for their needs, the extra costs must be weighed against such factors as the saving of human lives and achieving minimum warning time for retaliatory offensive operations.

• **Redundancy studies**—Studies performed at Hughes Aircraft Company have shown that internally redundant systems using standard parts are considerably more reliable than conventional systems using specially chosen components. But they have indicated that although the failure probability can be reduced by a factor of "hundreds or more" system redundancy should be used with great discretion.

These systems, said S. Nozick of Hughes, are heavier, larger, and require more maintenance. He stated that internal redundance should be favored only when system failure is very critical in terms of human life or money. External functional redundance—the technique of relying on all or part of another system to replace functionally the failed system—should be considered by designers as an alternative to internal redundance.

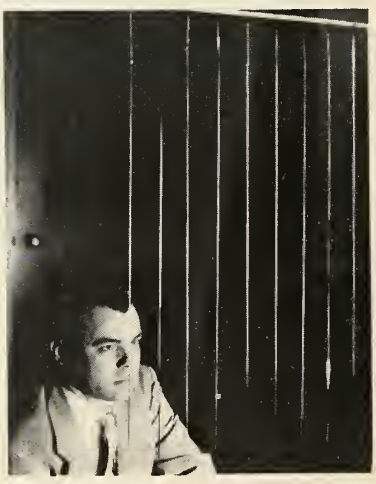
Speaking of a well-integrated developmental team designing a highly reliable system with a suitable redundant configuration, Nozick said: ". . . a closely coordinated group with high morale can invent its way out of the problems that usually arise." He also warned that consideration must be given to the fact that parallel or redundant circuitry might relax the control required on components or subsystems during equipment construction and component specification.

• **Future reliability**—In the present state of the art of redundant circuit design, the requirement for specially trained engineering groups needed to develop these systems is paramount. Although reliability can be improved substantially, redundancy is always expensive and frequently inadequate.

The answer to achieving higher reliability seemingly does not lie with redundant design as we know it, but the technique is an effective and existing tool.

One potential source for increasing circuit redundancy, especially in missilery, is in the future use of semiconductor "solid-circuitry" developed by Texas Instrument Co. and Westinghouse. Because of the small size and weight and very low power needed, these functional circuits may offer a vastly different kind of redundancy in years to come.

New Way to "Grow" Germanium



ANDREWS AFB, Md.—Westinghouse Electric Corporation's process for "growing" germanium crystals in uniform, thin, flat ribbons has earned it a $2-million development contract from the Air Research and Development Command. In addition, Westinghouse's use of this material to create "functional" solid state circuits is another step toward revising current electronic design concepts.

In announcing the contract award by Wright Air Development Center, Maj. Gen. John W. Sessums, Jr., commander ARDC, said it was part of a broad program effort in this new field of molecular electronics.

The development centers on the method of growing the crystals, since the final product eliminates the need for tedious and costly slicing and polishing heretofore required. Westinghouse scientists said the manufacturing technique permits growing the material in the exact form in which it can be used for practical application in transistors and other semiconductor components.

A result of a new knowledge of the structure of material, the company believes the new method will radically improve existing transistor manufacturing processes. Westinghouse already envisions machines turning out finished transistors at high speed directly from on input of raw germanium and the two or three other materials needed to complete the device.

The new technique for growing germanium was the work of two Westinghouse research physicists, Dr. R. L. Longini and Dr. A. I. Bennett, both of the laboratories' solid state physics department.

DR. BENNETT, codeveloper of new growth process, and the new germanium ribbons.

"The ease of processing dendritic germanium into usable form contrasts sharply with present practices," the Westinghouse scientists said. "To process conventional germanium ingots into useful form, they must be sliced into thin wafers somewhat like a loaf of bread is cut into slices. Because germanium is so hard and brittle, the cutting is done with a diamond-tipped saw, and each slice has to be three to five times the desired thickness simply to keep it from shattering.

"The slices must then be ground down to the required thickness, further cut into small squares, and finally polished. Only then is the germanium ready to be fashioned into finished transistors or other devices. As a result of all this cutting and polishing, about 80% of the original ingot is thrown away as germanium 'sawdust.'"

Not only is dendritic germanium of the proper thickness for direct use, said the scientists, but its ultra-smooth, mirror-like surfaces need no grinding or polishing of any kind.

• **Functional circuits blocks**—Research results to date indicate that the new process and the use of functional semiconductor circuits may lead to the development of outer-space electronic equipment 1000 times smaller and lighter than anything now in existence. In describing foreseeable products resulting from the Air Force's development program, Col. Clarence H. Lewis, director of ARDC's Electronics Directorate, said the concept could take the average pocket-sized transistor radio circuitry excluding the power supply and speaker down to the size of the head of a match."

In use, these very small pieces of crystal could perform the functions that now require as many as a dozen present-day components using conventional circuitry, Col. Lewis said. He added that two possible functions of the minute equipment are the sensing of environmental conditions and transmitting the data to any desired location. Feasibility studies are being conducted on infrared, reconnaissance, flight control, communications, and other military applications.

As an example of the size and weight reductions possible under the

ıew concept, Col. Lewis said that thc nost modern system used today to neasure the intensity of light in space ıas a volume of about one cubic inch ınd a weight of approximately seven grains.

The Air Force has conducted demonstrations with a Westinghouse light elemetry subsystem which has a volume of 0.001 cubic inch and a total veight of 0.2 gram. This equipment ıot only measures change in light intensity but also produces a signal capble of transmission to relate the degree of change in intensity.

The number of component parts in he telemetry subsystem was cut from 4 to 1 and the number of soldered connections was reduced from 15 to 2, hereby offering a tremendous potential o reliability, Col. Lewis said.

Ohio State Team Makes Low-Cost Radio Telescope

WASHINGTON—A unique radio telescope being built by a "professor-student" team of Ohio State University will permit mapping the sky at a minimum cost.

Scheduled to be ready for operation in 1960, the telescope will consist of a fixed paraboloidal antenna, a flat tiltable reflector, and associated radio receiving equipment. Both 360 feet long, the fixed dish is 70 feet high and the tiltable antenna is 100 feet high. Collecting area of the latter is equivalent to that of a 170-foot diameter steerable dish and it costs about 90% less.

Under the direction of Dr. John D. Kraus and three non-student assistants, the system is now in construction. The project is supported by three National Science Foundation grants totaling $272,650 and two university grants totaling $21,600. A 20-acre site has been donated by Ohio Wesleyan which also will control the surrounding land to prevent any operational interference.

Radio waves from the sky area under observation will be received on the tiltable antenna, reflected horizontally to the fixed dish, and then directed to the receiver system for recording.

All components of the telescope will be in fixed position on the ground. The earth's rotation brings new radiation sources in the sky into the field covered by the telescope. In a 24-hour period, a narrow band entirely across the sky can be "mapped." Changing the angle of the tiltable reflector will move the band of observation up or down, so that eventually a large part of the sky can be fully mapped.

The design of the telescope is sufficiently flexible to capture and identify radiation from a wavelength of 21 centimeters up to about 20 meters. The geometry of its design provides that regardless of the angle of the tiltable reflector, radiation striking it will be deflected via the fixed antenna to the receiver. Structural problems arising from mounting receivers high in the air on movable antennas are also avoided in Dr. Kraus' cost-saving design.

This telescope will not be able to follow an object across the sky as well as steerable dish antennas can, but will depend primarily upon the earth's rotation for its collecting area.

hush-hush?

If you're now involved, or becoming involved, in hush-hush projects, you know how vital it is to have sources who can deliver on time, to rigid specifications. That's why it's important to constantly investigate and compare **new sources — to be sure!**

Cleveland Tool and Die Company has the capacity, ability and facilities* to insure your success. We're precision **specialists** in the manufacture of component mechanisms, sub assemblies, gages and fixtures . . . in custom machining, boring and grinding.

We've performed an important part in such exotic projects as the Shippingsport atomic reactor, the U.S.S. Nautilus, Redstone Arsenal, and Princeton's new synchrocyclotron. **When you talk to CTD, you know you're talking to qualified, dependable people.**

LIGHTWEIGHT airborne electronic cooling package

PERFORMANCE CHARACTERISTICS–
Heat Rejection: 200 watts... Inlet Gas Temperature to Component Housing: 130°F.... Weight of Fan, Evaporator and Controls: 1.25 lb.

Spans the gap between direct ambient cooling and closed cycle systems

● *This AiResearch open-cycle cooling unit* is designed for environmental conditioning of electronic and electromechanical equipment in problems of low total heat dissipation aboard aircraft and missiles.

Much lighter and less complex in operation than closed cycle systems, this compact package is recommended when required total heat dissipation is low... large heat loads for short periods of time, or small heat loads for long periods of time. It also replaces direct ambient cooling systems when ambient sink is not low enough or not easily available.

Ammonia in this expendable evaporative system cools sulfur hexafluoride (SF_6) which passes over the hot electronic components. The SF_6 then recirculates for cooling, and the ammonia is dumped overboard.

Applications of this system include: inertial guidance system cooling, missile transient cooling, and spot cooling where ambient sink is not available.

AiResearch has designed and manufactured cooling systems of all types ... direct ambient, closed and open-cycle systems handling all magnitudes of cooling loads and utilizing various working fluids. We invite you to send us details of your problem.

'Quite sure' Bell-Martin will land contract . . .

BELL'S Dr. Walter Dornberger, "a man of stereophonic sound."

'Father' of *Dyna-Soar* Awaits AF Decision

by Erica M. Karr

WASHINGTON—An Air Force Source election Board is sifting data to de- ide which of two pooled-company eams will get the *Dyna-Soar* contract. Optimistic reports say the decision will e made by mid-June. Others close to he project indicate a more realistic et is after July 1.

During the last two weeks of April, AF evaluation teams, numbering close o 100 technical experts, descended on The Martin Co. in Baltimore and the Boeing Airplane Co.'s Pilotless Air- craft Division in Seattle for an on-the- pot appraisal to guide the 20-man election board. Winner of this two- way contest will walk off with a con- tract which may eventually total $650 million to develop *Dyna-Soar* (from dynamic soaring).

The Air Force has asked Congress or $109.8 million in new obligational uthority for *Dyna-Soar* in Fiscal Year 960, with actual expenditures to run o $73 million in that period.

The manned boost-glide vehicle will ave a global capability. Initially, it vill be developed as a prototype test ystem to explore the flight region eyond that of the *X-15*, and extend- ng to near-satellite velocities and alti- udes.

It will be a ground-launched, step- ype vehicle, initially boosted to very igh altitude and speed by ballistic mis- ile boosters which fall away from the npowered, man-carrying last-stage lider. It will be a "laboratory" for athering information needed in later pace development work.

One military role envisioned for ater versions is in the "missile storage n space" concept. Idea would be to ave earth continually ringed with or- iting hydrogen-missile-carrying *Dyna- Soars* which would be controlled from space station, eliminating the need for vulnerable ground facilities and advance warning systems. These could be unleashed for instant retaliation wherever needed. It is estimated that $1.2 billion annually could maintain such a defense network.

• **Line-ups**—Each of the two competing industrial giants is backed up by a group of companies ready to pool their technical resources in a new approach to system building—the company team concept as opposed to the prime-subcontractor systems. On the Martin-Bell team are Bendix, Minneapolis-Honeywell, AMF and Goodyear Aircraft. Boeing, which also has Goodyear on its team, has in addition North American Aviation, Aerojet, Chance Vought Aircraft, General Electric, RCA, and Ramo-Wooldridge.

Dr. Walter Dornberger, originator of the *Dyna-Soar* project, and recently named as engineering director of Bell Aircraft's Niagara Frontier Division, is sure that the contract will go to the Martin-Bell team. If so, the ex-German rocket expert will direct work on development of the glider vehicle. Asked "If not?", Dornberger replied: "Then we will work on another version of *Dyna-Soar* or satellite interceptors, rescue ships, maintenance and supply ships, a shuttle rocket to space stations or the final stage of a moon rocket."

• **Dornberger's vision**—Dr. Dornberger is a longtime booster of the team approach to space flight and raised some eyebrows during last year's meeting of the National Missile Industries Conference when he said in a speech: "We cannot afford competition for contracts to build space ships.

"In the coming years we will see only a few industrial combines able to develop big space ships. By pooling facilities, brains and manpower, they alone will provide the necessary capability and productive power to which the nation may hand the technological responsibility in the Space Age."

Dornberger is an old hand at new concepts, dating back to 1930 when he found himself heading a small group in Germany's Army Ordnance Division which had been directed to make modern weapons out of rockets. Later, the man who was to become Wernher von Braun's boss directed the 17,000-man Peenemunde rocket operation which developed and launched the *V-2's* during World War II.

Dornberger began pushing the idea of the rocket-boosted glider soon after he came to Bell Aircraft in 1950. Bell, in turn, started pushing it with the Air Force in 1952 when it was called *Bomi* for bomber-missile; but it was not until Russia launched *Sputnik I* that the Pentagon worked up any enthusiasm and got the ball rolling.

• **Forceful**—The father of *Dyna-Soar* is a man of strong opinions who expresses them in clipped, colorful, German-accented pronouncements illustrated with forceful gestures. Said one science reporter after a Dornberger press conference: "He's the world's only human who speaks in technicolor and stereophonic sound."

Although his Prussian manner and opinionatedness rub many newspapermen the wrong way, his sweeping assertions always make lively copy. Sample quotes:

Education—*Our system is all wrong. Everyone who has the brains and guts should get a higher education despite lack of money.*

Vanguard—Vanguard was a mistake. We should have used existing hardware. We would have had a satellite up sooner.

Goals—*The future problem is no longer to bring a couple of tons of payload into orbit but to bring 20, 30 or even more tons at any spot in space with the correct direction and speed.*

Manned vs. unmanned—*Space can only be utilized effectively by manned vehicles. An automatic space vehicle would necessarily have to be so complex that the possibility of its failure in space would be tremendous. Space will be conquered by man and not by machines.*

Anti-missile missiles—*Practically useless. Out of 100 ballistic missiles shot at us, 90 would get through with the present state of the art on anti-missile missiles.*

Long-range planning—*We should agree on a line of priorities for the next 20 years to survive as a free nation. Priorities should run in this order: (1) long-range ballistic missiles; (2) data-gathering research vehicles for cis-lunar space; (3) all weapon system, manned or unmanned, in cis-lunar space; (4) data-gathering research vehicles for trans-lunar space; (5) space vehicles for commercial application; (6) prestige flights; (7) stunt flights.*

Space Race—*Russia may put a man-carrying satellite into orbit within the next year. It may take us three years to do this.*

Royalties for scientists—*Creative thinking and imaginative engineering should be paid for . . . the government should guarantee a share in the profit of later production for the original creative mind.*

Need for speed in the space race—*I have lost two world wars. I did not come to this country to lose World War III.*

• **Nazi failure**—If the Nazi wheels had listened to Dornberger, the history of World War II might well have been different. But despite Dornberger's urging, Germany's rocket-weapon program went into high gear too late.

Getting it off the ground had been for a long time literally a go, no-go proposition. Gen. Prof. Dr. Karl Becker, head of the Board of Ordnance, had trouble laying his hands on the money needed to launch this "outlandish" idea; finally in 1932 he ordered all Ordnance divisions to contribute 10% of their budget to Dornberger's project.

In all it cost $300 million to develop the *V-2*.

There was not much in the way of previous rocket research and the team had to start from scratch: How big? How much payload? What distance? "I sat down with Von Braun and an artilleryist and we arbitrarily decided to make the payload 100 times that of the Parisian 10-pound gun with over twice its distance of 50 miles. Size was determined by the tunnels and streets through which it would be transported."

First successful firing of the *V-2* was not until October, 1942, and there were 36 more before they achieved a second successful firing—"A lot exploded on the ground; we had no telemetering system, either, to tell us what was wrong."

When problems came up, Dornberger said, "I put my men in a room and told them 'You get nothing to eat until you come to a conclusion.' By 1943 they had achieved 50% reliability, by 1945—78% and they were firing 30 a day.

Von Braun, now director of the Army's missile development at Redstone Arsenal, recalling his early years with his old chief, told M/R:

"Dr. Dornberger and I first met in 1932 when I was a student at the Technical University of Berlin, and it marked the beginning of 13 years of close association and the beginning of a rocket development program with far-reaching implications.

"Selling the new ideas of rocket propulsion and promoting and fighting for the support of adequate programs to fully develop its potentials, was a tremendous undertaking. It required courage, dedication and passionate perseverance. Dr. Dornberger led us from the shortcomings of our 1932 presentations and transformed our youthful enthusiasm into sober engineering plans.

"He is a man of profound technical knowledge, imagination and the ability to combine the technically feasible with the militarily sound and practicable. These, together with his personal tolerance and warmhearted understanding for the capabilities, limitations and personal problems of his associates, made Dr. Dornberger the greatest single force behind German rocket development. And he shared with his younger associates the deep fascination for the limitless challenge of future space exploration.

"He was to me a courageous, fatherly friend who, in many dangerous and critical situations, in particular during the declining months of Hitler's Germany, never let me down. On more than one occasion he helped me at considerable risk to his own safety."

After the war Dornberger came to the United States as a missile design consultant for the Air Force at Wright-Patterson AFB, and in 1950 joined Bell in a similar post.

He was appointed technical assistant to Bell's president in 1957, and was named to his new post April 13th this year.

Today, Dornberger, whose life for the most part was focused high above the clouds, has completed long-range plans for ending it there: "I want to be the first man buried in space. When I die I want my ashes put in a glass urn and carried up by a manned space capsule to orbit in eternity." "Von Braun said he will take them up there," said Dornberger, eyes twinkling. He added mischeviously: "Von Braun says it will be an urn with a hook and every year on the anniversary of my death he will soar up and hang a wreath on it."

Dyna-Soar: First Maneuverable Spacecraft

Dyna-Soar's early explorations through the atmospheric fringes will erase many of the question marks confounding man as he plans for space exploration. The rocket-boosted glider will be a bridge between aerodynamic and space flight. It could be used for bombing, reconnaissance and scientific and commercial missions.

The domain of the *Dyna-Soar* will be that area between the ceiling for air-breathing engines—almost 19 miles up—and the floor for satellites—slightly over 93 miles up. Excursions out of this area will pose some problems, not the least of which will be temperature.

The glider's return to earth will be controlled from the ground, as will positioning in orbit.

In its early flights, *Dyna-Soar* probably will be unmanned and will be recovered after several orbits by an automatic system already demonstrated by Bell Aircraft. However, even when manned, it will be brought back by automatic control.

Presentation of information may offer a stiff challenge. Re-entry involves velocities from satellite down to sonic, aerodynamic lift varying from 1 or 2% to 100% of weight, and accelerations and temperature changes which are limited by the structure and payload. Processing this information to adjust the re-entry path will be an important system requirement.

Accuracy requirements for the boosted phase can be greatly diminished if the vehicle has the maneuvering capability to modify or correct an initial orbit or trajectory. This would reduce the amount of ground or airborne information needed, and the sophistication of components. The correction would be pilot-controlled

ARTIST's conception of a later-day *Dyna-Soar* with lentil configuration entering the earth's atmosphere at a 90° angle.

• **Configuration**—What will *Dyna-Soar* look like? The work of Julian Allen and A. J. Eggers indicates that blunt shapes with high-pressure drag would be most efficient for skip gliding since these characteristics minimize aerodynamic heating, particularly for relatively light vehicles. Later variations of this concept include the lentil configuration which would enter the atmosphere at an angle of attack of 90°. in this way acting as a blunt shape. Another possibility is a blunt-nosed vehicle, which after achieving entry would rotate to 180° so that a low-drag "tail" becomes the leading element. Bell's *Dyna-Soar* reportedly will have the blunt-nosed Allen configuration.

Dyna-Soar will not skip as it glides down at slow deceleration and its shape will be based on a high lift-over drag factor. The Lentil configuration will probably emerge in one of the later *Dyna-Soar* versions.

Bell Aircraft's mock-up of *Dyna-Soar*, still under security wraps, was viewed by the Air Force's evaluation team on its appraisal visit to The Martin Co., Baltimore, last week.

• **Human factor**—Keeping the pilot comfortable under the space-equivalent conditions he faces in *Dyna-Soar* means that for the region near or below the glider's flight planners must cope with the vapor pressure of body fluids in mammals—47 mm Hg (63,000 ft.). Oxygen supply will not be as much of a problem as in orbiting vehicles because flights can be short.

Acceleration and vibration will be similar to those in the launching and flight of a satellite and can be kept to similar levels during re-entry. One aim is to allow the crew to function without confinement of pressure suits or thermal shields.

• **Power**—Early versions of the glider could be satisfactorily launched by existing rocket boosters—*Titan*, for example. However, later versions will be larger and heavier to achieve maneuverability in space; hence increased booster capability will be necessary. Thought must be given to recoverable boosters, apart from the already recoverable final stage, for economy reasons. An air-breathing first stage might be used; then re-use would be a necessity.

• **Rendezvous**—To meet orbiting objects in space, the glider will need vernier adjustments in velocity. If the orbiting vehicle is radiating elctromagnetic energy, homing on this source could be achieved within the vehicle.

The power required for the glider to "jump" orbit is comparable to that in the original launch. In time these vehicles will be large enough to carry adequate propellants for making major modifications to orbits.

A vehicle weighing 11,000 pounds coming from a satellite orbit must dissipate 1.58 x 10^{10} kgm of energy (11.45 x 10^{10} ft. lbs.) before it lands. According to Dr. Everett T. Welmers of Bell Aircraft Corp., most of this must be achieved by radiation.

"A solution to this design problem which has been developed at Bell is the use of the 'double wall' structure," Dr. Welmers reports. "The outer wall, exposed to the airstream, is allowed to heat up to very high temperatures. Radiation from this surface back to space is approximately proportional to the fourth power of the temperature. The inner wall, which carries the structural loads, is shielded from the hot outer face by a layer of insulation and is further cooled by liquid passing through tubes attached to its surface. In this way all but a small percentage of the aerodynamic heating is re-radiated, the load-carrying structure is subjected to temperatures of about 200°F and thermal problems for equipment and crew inside the double wall become very simple."

The outer wall is of Inconel and can take over 2000°F. The inner wall is of aluminum.

Atmospheric density at 328,000 feet is such that the vehicle could maneuver at less than .01 g through aerodynamic forces. At 246,000 ft., aerodynamic pullout will be about one-third g's; at 180,500 ft., a maximum of about 2.5 g's. Below this altitude, structural limitations are likely to be more influential than aerodynamic forces.

• **Landing**—Between the time the pilot decides to land and actual touchdown *Dyna-Soar* will have traversed from one quarter to several times the earth's circumference. If re-entry and slowdown come off as scheduled, the vehicle, brought in by the automatic landing system, will be able to land within a rectangle of 2 x 5 miles. Tests at Bell Aircraft have achieved this with planes and guided missiles.

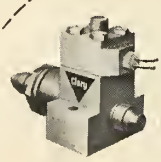
Both the Air Force and Navy have proposed that a coordinating body be set up for the Atlantic and Pacific missile range tracking networks—first for the *Mercury* project, then for *Dyna-Soar*. This is currently being discussed, at least by the Air Force and NASA.

• **Background**—Before the *V-2* program roared into high gear and halted work on it, the glide vehicle conceived by a German team under Dornberger's direction worked like this: The *A-9*, a variation of the *V-2*, was to carry under it another vehicle weighing 191 thousand pounds. Termed the *A-10*, this rocket booster would have a 50 to 60-second thrust to 440,000 pounds and a velocity of 2700 mph. At the *A-10's* burnout, the *A-9* would ignite. It would begin its supersonic glide at 35 miles altitude and travel a distance of 2500 miles.

This was based in part on the earlier work of E. Saenger and I. Bredt. Russia's glide-bomber work has resulted in the three-stage *T-4A* test vehicle. It is believed to have a 264,000-lb. liquid rocket first stage supplemented by two solid-propellant rockets. The second stage used the same liquid rocket and the third stage a 77,000-lb. rocket. It is estimated that take-off weight is over 231,000 lbs. and that it reaches a maximum altitude of 235 miles with ranges of 500 to 12,500 miles with top velocities of 5000-6500 m/sec. (16,400-21,300 ft/sec.)

Just how far the Russians have carried this program to date is not known.

Light,
reliable
Clary valves...

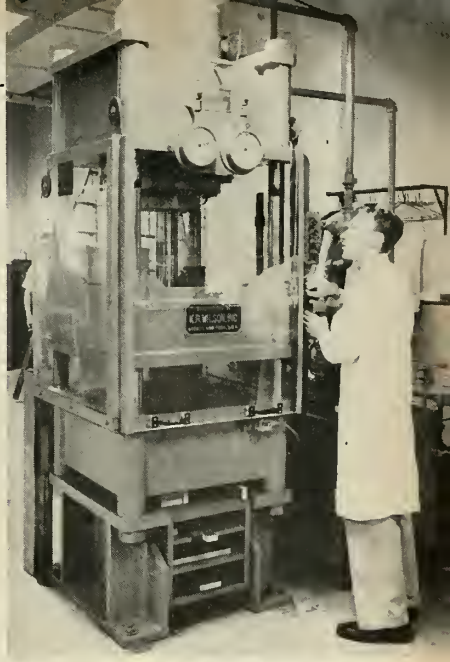


accurately control all types of gases and liquids under the most stringent environmental conditions

Helium, air, corrosive liquids, nitrogen, LOX, hydrogen peroxide – you name it, and these Clary valves will handle it, surely and capably. Their reliability is assured by manufacturing tolerances that frequently reach seven millionths of an inch, and by Clary's complete facilities for extreme environmental conditions testing.

When you want light, reliable, versatile, precision-built valves, come to Clary – one of the nation's largest manufacturers of valves in all types and sizes for aircraft and missiles.

SOLENOID VALVE
3-WAY, NORMALLY OPEN OR CLOSED
features:
hermetically sealed coil, low current consumption and rotable solenoid.
Rated Operating Pressure: 3000 PSIG
Voltage: 18-30 DC · Burst Pressure: 7500 PSIG
Connector: CD 3102-12S-3P · Leakage: Zero
Seals: "O" rings compatible with media
Ambient Temperature Range:
–65°F. to 160°F.



EXPLOSIVE VALVE
features:
positive on-off action, trigger release and protected seat.
Re-usable – just replace squib without disconnecting valve. Ball or poppett type construction. Standard sizes up to 2"– larger to specific requirements.

Low-Cost Brazed Steel Honeycomb Structures

Martin's new hardened alloy solves problem of uneven filleting in brazing and allows opening of tolerances

200-TON PRESS is used to press the reduced powders of Al_2O_3 and matrix metal.

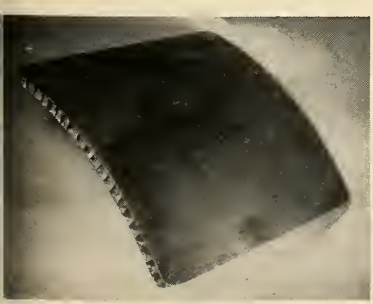
by Clarence A. Boyce, Jr.*

BALTIMORE—Brazing alloys available until now have made production of brazed steel honeycomb structures both difficult and expensive. The chief problem: uneven filleting caused by rapid flow of the alloy and its poor resistance to corrosion.

These limitations have been overcome in a new dispersion-hardened alloy developed by the Baltimore Division of the Martin Co.

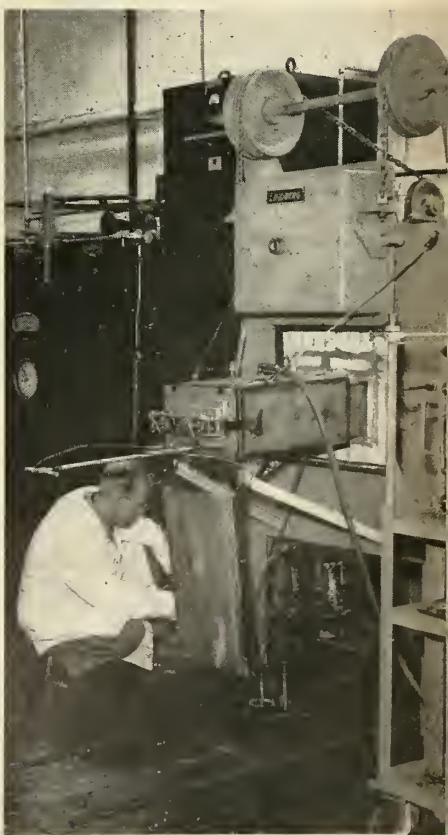
The alloy is produced according to established powder metallurgy techniques. The initial distribution of the aluminum oxide in the metal matrix follows a method developed by R. H. Read while he was investigating the properties of dispersion-hardened copper. Read dispersed the aluminum oxide in copper oxide by wet milling the appropriate mixture.

This method is superior to mixing copper directly with alumina, because the latter method yields a smeared matrix and a non-uniform mixture. Since the oxide is harder than the parent metal, it is broken up readily without noticeable plastic flow and smearing.



Following the milling operation the mixture is heated in a hydrogen atmosphere where the copper oxide is reduced to copper while the alumina, being very stable, remains unaffected. The powder is then pressed and processed by the usual powder metallurgy techniques.

• **Fine screening**—In the development of the Martin brazing alloy, the copper oxide was replaced by another oxide. The mixture was ball-milled wet in a conventional mill for two to three weeks.



After drying, the powder was screened through a −180 mesh sieve to eliminate any large particles and treated in a hydrogen atmosphere at 75°-100°C for 2½ hours to reduce the oxide of the matrix to the metal, the alumina remaining unchanged.

The power was screened again through a −100 mesh sieve in preparation for briquetting. It was poured and leveled at a depth of 0.029 inches in a "push through" die having a rectangular opening of 1 3/8 x 4½ inches and

*Research Institute for Advanced Studies, The Martin Co.

COMPLETELY BRAZED panel using aluminum oxide dispersion-hardened brazing alloy.

SMALL FURNACE is used to sinter briquetted powders at Martin Company's Baltimore facility.

STRIKE OF THE HAWK!

RAYTHEON-DESIGNED Hawk missile annihilates radio-controlled F-80 jet fighter at 500 ft. altitude.

ARMY'S HAWK MISSILE is fired from mobile launcher. Missiles, launcher and support equipment can be air-lifted or quickly transported by Army or Marine ground forces.

NEW ARMY MISSILE DESTROYS LOW-FLYING AIRCRAFT

This *proven* anti-aircraft missile operates even at tree-top heights, in the blind zone of other radar-controlled missiles.

Raytheon is prime contractor for the U.S. Army Hawk weapon system—now in production and slated for use with fast-moving Army and Marine Corps ground forces as well as for the defense of U. S. cities.

RAYTHEON

Excellence in Electronics

RAYTHEON MANUFACTURING COMPANY, Waltham, Mass.

pressed at 200 tons. The most desirable size for the finished briquette prior to sintering was 0.050 inch thickness. The briquettes were then sintered at 1700°C for two hours and reheated prior to the rolling operations for a minimum of five minutes at 1700°F.

With the roll opening set 0.008 inches less than the briquette thickness, each briquette was hot rolled in a mill. The roll opening was subsequently reduced 0.004 inches prior to each heating and rolling operation and each briquette was given three passes through the rolls after each heating cycle. The heating and rolling operations stopped when the material reached a thickness of 0.020 inches. It was subsequently cold rolled.

• **Fluxing agent needed**—By continually decreasing the roll opening until the rolls were completely closed, eventually the material was reduced to a foil 0.001 inches thick. The finished foil was then ready for evaluation as a brazing alloy.

In the preliminary tests the aluminum oxide dispersion-hardened alloy would not wet steel very readily at 1800°F and 1900°F. It was thus evident that a fluxing agent was required in conjunction with the new filler alloy.

A foil of 99.7% silver alloy containing 0.3% lithium was placed in contact with the dispersion-hardened foil and the combination placed between the skin and the honeycomb. During the brazing cycle the lithium in the silver-lithium foil was concentrated enough to flux the core and the skin very thoroughly. Thus a successful brazed joint was achieved.

• **Psi increased**—A difference was noted between the flow of the silver-lithium and the composite alloy consisting of a layer of silver-lithium and the dispersion-hardened alloy. Specimen of 17-7PH stainless steel brazed with the silver-lithium showed slightly more flow than the other specimens brazed with the composite material.

Secondly, evaluation tests indicated the strength of the lap joints containing the dispersion-hardened silver was around 17,000 psi, whereas the silver-lithium joint yielded shear strengths of 11,500 psi. Thus a definite strength increase was shown which prompted further investigation and application.

Honeycomb panel brazed with commercially available brazing alloy produced areas of no brazing caused by starvation of the top surface. However, no starvation appeared after brazing with silver dispersion-hardened material.

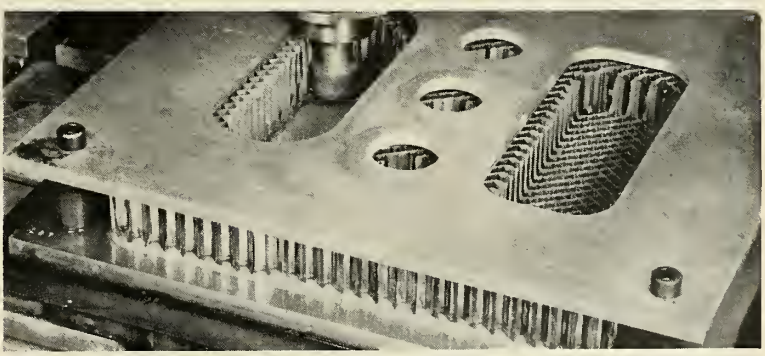
The Martin Company is proceeding to braze larger and more complex panels. It is continuing the investigation of other fluxing agents and techniques and adding particles other than aluminum oxide as the hardening medium.

• **No adhesive**—Extremes of high and low temperatures in the environment of supersonic weapons systems have clearly shown the need for new materials and manufacturing processes for the fabrication of aircraft and missiles that can endure this environment.

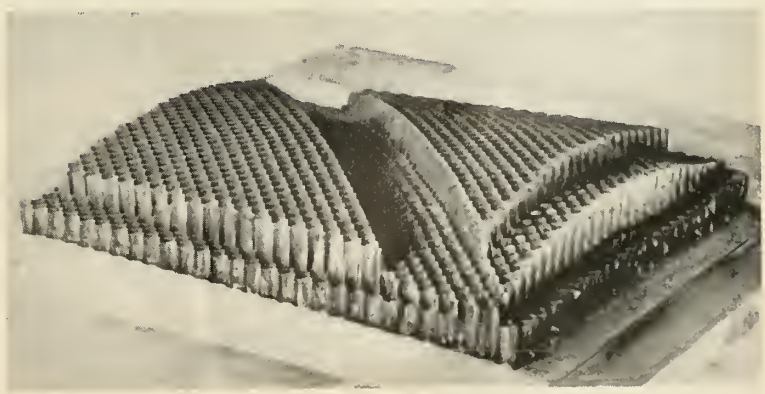
The design of the weapons systems that will be operational in the early 1960's is far ahead of the industrial ability to manufacture them. The selection of stainless steel as the material to be used in these systems, because of its characteristic resistance to extremes of temperature, has brought on the problem of how to join the parts of an assembly.

With slower flying aluminum planes, adhesive bonding was adequate since the operational temperatures were never high enough to affect the adhesive bond. But with temperatures high enough to require the use of stainless steel, an adhesive bond is rendered useless. The only solution is to use a metal joint capable of enduring such an environment.

Brazing seemed to offer the answer until experiments showed that available brazing alloys flowed too readily. This caused the bottom joint to be too heavy and the top joint too light or to have no braze at all. Also these fillers showed a poor resistance to corrosion which could not be tolerated.



It was these deficiencies in the existing brazing alloys that convinced Martin that development of a new alloy was imperative.



• **Future significance**—Brazing accomplished with this new alloy shows that a sound, strong brazed structure with even filleting can be attained with none of the defects attendant on the use of other alloys. It also allows an opening of the tolerances since the sluggishness of the melted alloy allows it to stay where it is placed and bridge the increased gap between skin and core.

These properties were first suspected by Dr. Howard R. Peiffer during basic metallurgical experiments with silver at the Research Institute for Advanced Studies.

Important as this development is at present, its use in the missiles and space ships of the near future will show the real significance of this process.

Methods of Machining

DIAGONAL CUT on stainless steel honeycomb is made by using overlay template for cavity machining. Lower picture shows how spiral cut is made in contour machining.

Board Chairman George M. Bunker continues as Martin Co.'s chief executive officer. But under management realignment, former executive vp William B. Bergen becomes president and principal operating officer. Move frees Bunker for long-range planning.

In a top management reshuffle, Frank Pace, Jr. has been named chairman of the board of General Dynamics Corp. Succeeding Pace as president is former executive vice president Earl Dallam Johnson. Carleton Shugg, a senior vp and general manager of the Electric Boat Division, moves up to president of Electric Boat. Elevated from general manager to president of the General Atomic Division is Dr. Frederic de Hoffmann.

Page Communications Engineers has become a wholly-owned subsidiary of the Northrop Corp. The company, engaged in Army and Navy communications, says it is working on a system to produce long-range, highly reliable air-to-ground and point-to-point communications over distances up to 3000 miles.

MIT's Dr. C. S. Draper, pioneer inventor of inertial guidance systems, is taking over the vacant chairmanship of the National Inventors Council. He succeeds the late Charles F. Kettering. Homer H. Ewing of Du Pont's development department has been named council secretary.

New fast tax write-off certificates issued by the Office of Civil and Defense Mobilization include: Thiokol Chemical, Bristol, Pa., 70% of $1.3 million; Sylvania Electric Products, Mountain View, Calif., 60% of $920,000 and Aeronutronic Systems, Calif., 60% of $401,000.

Missile stress factors will be featured at the Society for Experimental Stress Analysis meeting starting May 20 in Washington.

United Aircraft Corp.'s Hamilton Standard division is creating a new department for the design, development and production of specialized missile ground support equipment. Heading up the new organization is Edwin D. Eaton, formerly chief of experimental operations . . . Temco Aircraft Corp. is establishing a new electronics division and separate divisions for missiles and aircraft and aircraft overhaul. And B. F. Goodrich Co. and High Voltage Engineering Corp. have joined in the formation of Goodrich-High Voltage Astronautics Inc. to produce ion propulsion engines for space vehicles.

AF's *Hound Dog*—supersonic jet-propelled guided missile—was launched successfully for the first time April 23 from an Eglin AFB B-52 bomber. A two-stage *Cree* test vehicle fired the same day at Eglin went to an altitude of 70,000 feet to test a deceleration parachute for the *Mercury* manned space vehicle. A malfunction after ignition April 28 stopped a scheduled *Titan* stage separation test just as the vehicle was to leave the launch pad.

NORTH AMERICAN's *Hound Dog* air-to-ground missile carried by a Boeing B-52 jet of the Strategic Air Command. The new missile is currently in operational test.

Cape Operating at One-Fifth Capacity

WASHINGTON—The Cape Canaveral Missile Test Center—one of the key elements in the nation's space and missile program—is operating at only one-fifth of its current capacity.

Maj. Gen. D. N. Yates, commander of the half-billion-dollar test center, told M/R that Canaveral's present overall facilities could handle five times the present number of rocket launchings "without spending another dime."

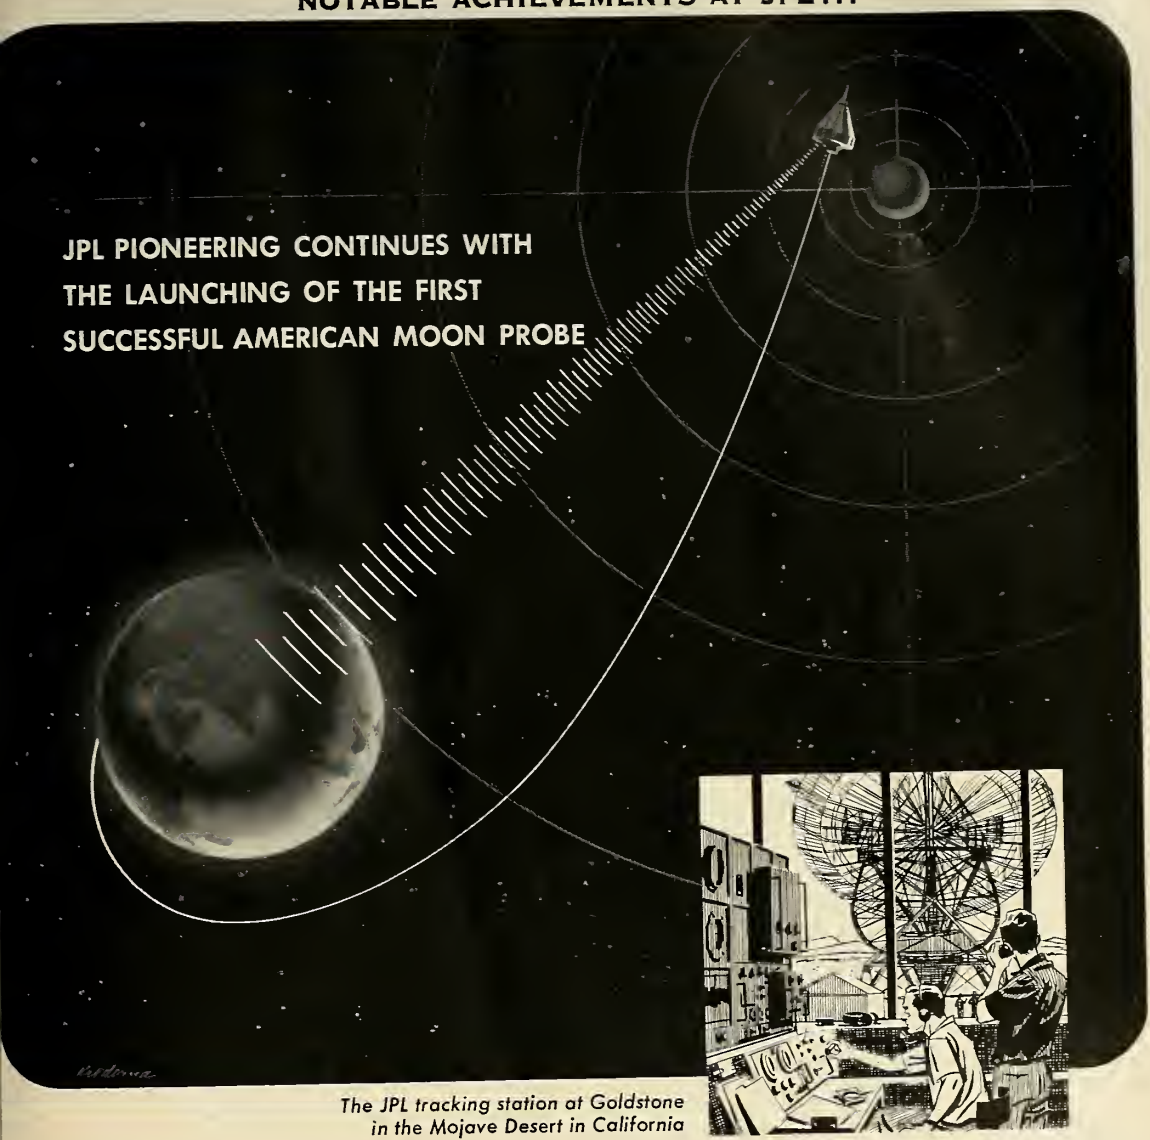
Some critics have charged the test center's capacity for handling rocket launchings was a roadblock to speeding up the nation's space program.

Yates said there are only two reasons why the center isn't launching more rockets:

- More launchings are not called for in particular rocket development programs.
- Or, additional rockets are not available.

Moreover, he said the center has room for increasing possibly 15 to 20 times the amount of testing including many new type rockets in the years ahead.

"We already are planning for test programs that we only are imagining," he said. "Huge rockets for space exploration projects that so far aren't even programmed."



Yates also said he thought the day is fast coming when both the U.S. Atlantic and Pacific Missile Ranges along with other missile ranges around the world must centrally coordinate their tracking and monitoring facilities.

"This type of coordination will be essential for such programs as Project *Mercury* and *Dyna-Soar*," he said.

On other developments, Yates said:

- The United States can have a man in orbit within a "year or so" under the current man-in-space program. However, much remains to be done before the goal can be achieved.
- U.S. engineers have developed a successful method for cutting off operation of solid propellant rockets in flight. The method being used is classified.
- The Boeing *Minuteman*, when ready for testing from the Cape, will be fired from a model of the inverted silos that will be used later to house *Minutemen* at hardened ICBM bases.
- Planning is underway for building facilities for testing the Martin *Pershing* and the 1.3-million-pound-thrust *Saturn* at the Cape.

JPL PIONEERING CONTINUES WITH THE LAUNCHING OF THE FIRST SUCCESSFUL AMERICAN MOON PROBE

The JPL tracking station at Goldstone in the Mojave Desert in California

Early on March 3, 1959, Pioneer IV space probe was launched from Cape Canaveral, Florida to become America's first deep-space vehicle capable of escaping the earth's gravitational pull. On its way past the moon and out into orbit around the sun, this new man-made planet sent back valuable information on the radiations present in space. Several Free World tracking stations clearly received its transmitted signal and helped to establish its distance, velocity, and direction.

Under the sponsorship of the National Aeronautics and Space Administration, JPL designed and built not only the conical payload of Pioneer IV but also the three upper stages of the Juno II launching vehicle, containing new high-performance JPL solid propellant rockets.

Over a year ago the same JPL team, in cooperation with ABMA, gave America its first earth satellite, Explorer I, using a similarly reliable vehicle—the Jupiter C.

Now, more advanced space vehicle programs are under way at JPL — programs which include development of guidance and propulsion systems for accurate maneuvers many million miles from the earth.

EXPANDED RESEARCH

to advance new concepts of SPACE FLIGHT

Expanded Research programs to meet the most complex technological requirements of the Space Age are only one of the far-reaching objectives of the new multi-million-dollar Lockheed Research Center, near Los Angeles. Destined to become one of the nation's major research installations, its programs are broad in scope and designed to investigate new frontiers of space flight.

A primary consideration in planning the new Research Center was to provide environment for scientific freedom and ideal research conditions —using the most advanced equipment available. This modern, integrated research facility will touch almost every aspect of aviation and transportation—leading toward exploration into completely new or relatively undeveloped fields of science and industry.

On completion, most of Lockheed's California Division's research facilities will be located in this single area. The Center will provide complete research facilities in all fields related to both atmospheric and space flight—including propulsion, physiology, aerodynamics and space dynamics; advanced electronics in microwave propagation and infrared; acoustics; mechanical and chemical engineering and plasma/magnetohydrodynamics; thermal electricity; optics; data communications; test and servo-mechanisms.

The first phase of the advanced research building program has already begun—with initial construction of a $5,000,000 supersonic wind tunnel and high-altitude environmental test facilities.

Scientists and engineers of high caliber are invited to take advantage of outstanding career opportunities in this new Lockheed Research Center. Openings now exist for thoroughly qualified personnel in: Electronics; aero and thermo dynamics; propulsion; servo-mechanisms; materials and processes; structures and stress; operations research; research in optics, infrared, acoustics, magnetohydrodynamics, instrumentation, mechanics and hydraulics; mathematics and in all phases of design.

Write today to: Mr. E. W. Des Lauriers, Manager Professional Placement Staff, Dept. 17051, 1708 Empire Avenue, Burbank, California.

NASA Names Hagen to Coordinate Programs

WASHINGTON—John P. Hagen, Director of the *Vanguard* Division since its inception, has been appointed Assistant Director for Program Coordination of the National Aeronautics and Space Administration.

Hagen will serve as operations manager of NASA's Office of Space Flight Development, coordinating and reviewing the progress of the office's various scientific and technical programs.

The *Vanguard* program, which Hagen directed first for the Navy and then for NASA, is being phased out. The rest of the *Vanguard* staff will be integrated into the Beltsville Space Flight Center.

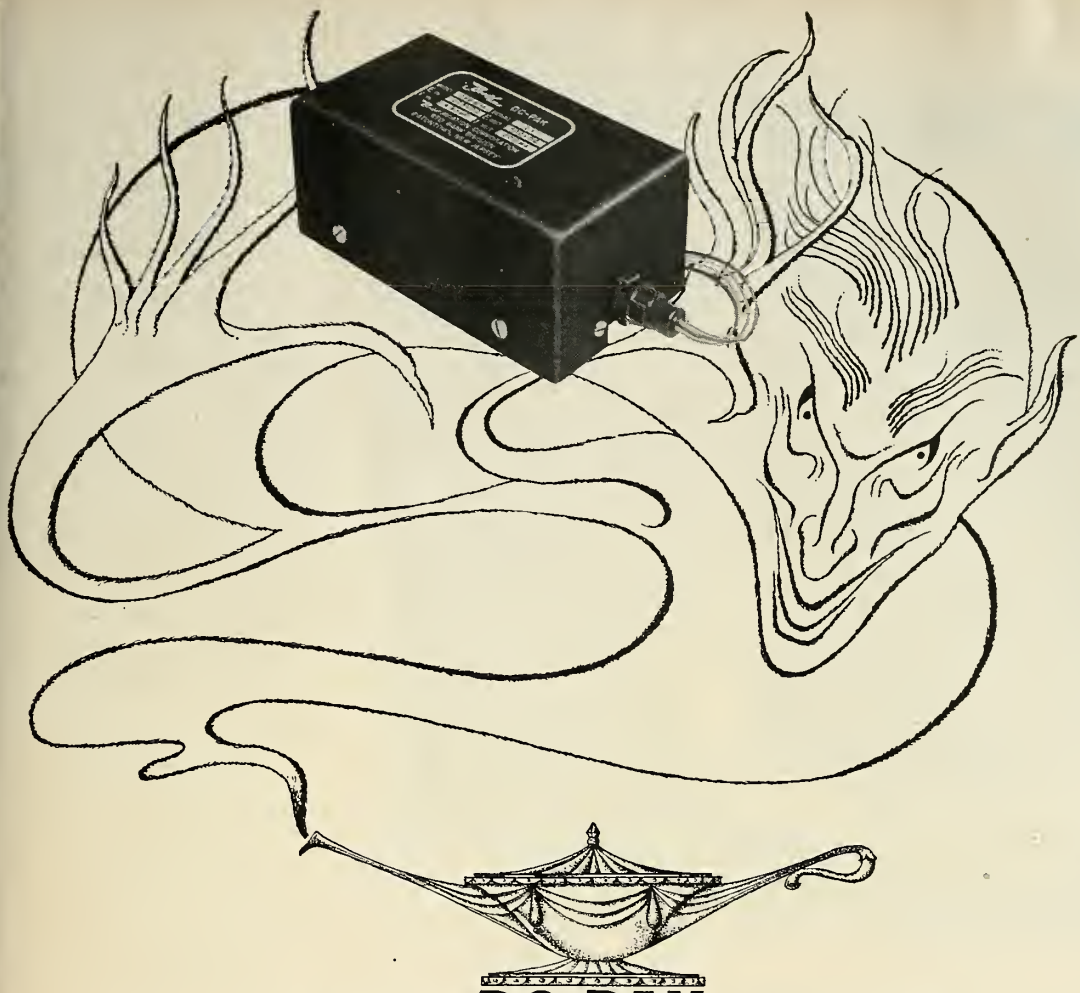
NASA Space Flight Center Named for Goddard

WASHINGTON—NASA Administrator T. Keith Glennan has announced that the agency's new 550-acre, 450-man Space Flight Center near Beltsville, Md., will be named for Robert H. Goddard, American pioneer in rocket research.

The Goddard Space Flight Center will perform NASA's basic space research and will be responsible for the development of satellites, space probes and vehicles, tracking, communications, and data reduction systems.

The Center's 100,000 square feet of laboratory and office floor space will be ready for occupancy in mid-1960. Its staff is now housed at the Naval Research Laboratories, at the Langley Research Center.

Organization of the new Center includes a director, not yet appointed, three major research and development groups headed by assistant directors, business administration and technical service departments.



The three major research groups, and their Assistant Directors, are:

Space Science and Satellite Applications—Directed by John W. Townsend, Jr., includes the Space Sciences, Theoretical Satellite Applications Systems, and Payload Systems Divisions.

Tracking and Data Systems—Directed by John T. Mengel, includes the Tracking Systems, Data Systems, and Support Divisions.

Manned Satellites—Directed by Robert R. Gilruth, includes the Flight Systems, Engineering and Specifications, and Operations Divisions, and also the *Mercury* manned space flight project.

Michael J. Vaccaro, former personnel director at the Lewis Research Center, has been appointed business manager of the Space Center.

New Bendix DC-PAK is like magic

REMENDOUS POWER OUTPUT IN A TINY STATIC PACKAGE

Vith its new line of DC-Paks*, Bendix now offers the latest in atic power supplies for the aircraft and missile industries. Light-eight and compact, the DC-Pak provides reliable power packaged the most practical manner for those industries where weight nd space are at a premium.

The DC-Pak is built to give thousands of hours of efficient, rouble-free operation. Made with only four major parts (and no ioving parts), it requires an absolute minimum of maintenance. or example, even a dead short across the output for a full hour ill not harm the DC-Pak. Also input surge protection can be rovided.

Units can be supplied with either single or multiple output, epending upon the needs of the customer. For full details on ese transistorized units—and how they can be tailored to your xact voltage and amperage requirements—write BENDIX AVIATION ORPORATION, EATONTOWN, NEW JERSEY.

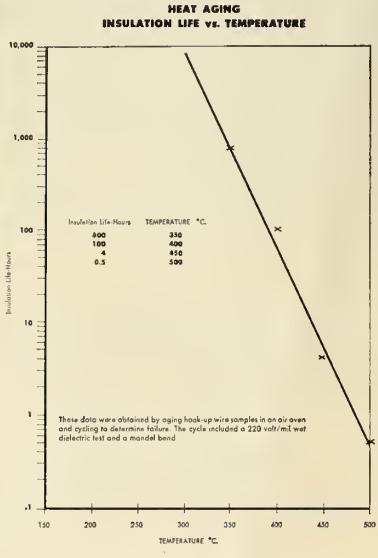
what's happening in Tucson?

TUCSON IS FREE of the tensions and hustle of big cities. Tucson offers its residents a truly cultural atmosphere in a dry healthful climate with an average of 11 hours of sunshine every day.

The University of Arizona, with an enrollment over 15,000, functions as the center of cultural activities—offering a variety of orchestral, choral and dance programs. The fine Tucson Symphony plays regularly at the famed Temple of Music and Art.

The Fine Arts Show and Photo Workshop climax the year's activities in the visual arts with exhibitions and symposiums. Tucson's reputation is attracting many fine artists who make this their home. The Fashion Fiesta in February displays the latest work of the Southwest's top designers.

Spring Training activities of the Cleveland Indians...the Saturday Evening Forum (the nation's largest community forum)...the world famed rodeos and Spanish celebrations...these and more make Tucson a stimulating, rewarding place to live...and work.



(For more details see opposite page.)

Teflon Insulation

To the Editor:

In a recent issue you published a letter from J. G. Lindberg concerning the electrical properties of wire insulated with "Teflon" (R) TFE-fluorocarbon resin at elevated temperatures. The letter left an erroneous impression that the electrical properties of "Teflon" TFE resins were greatly reduced at temperatures above 730°F.

We have run very extensive heat aging tests on wire insulated with "Teflon" TFE resin and find that it is continuously serviceable at 260°C (500°F). It is also serviceable for finite times at temperatures above 500°F as shown by the attached graph.

The table shows other typical values of dielectric strength at elevated temperatures. The values of the hours of expected life for hook-up wire have been substantiated for magnet wire insulated with "Teflon" TFE resins by other laboratories. It is interesting to note that at a temperature of 735°F the weight loss of "Teflon" TFE resin is extremely small. Its value is 0.071% per hour.

As a practical test we have subjected various samples of wire to overload currents. A coil of AWG #22 wire insulated with "Teflon" TFE resin and fabricated to conform to MIL-W-7139B construction was subjected to a current of 25 amps. The exterior of the insulation reached a temperature in excess of 425°C in 35 seconds. The temperature of the conductor was not measured.

Although vapors were evident, the wire continued to carry the current without fault until the test was terminated after two minutes. Other high-temperature resins similarly tested melted and faulted between conductors or burst into flames in less than one minute.

From these data it is evident that wir insulated with "Teflon" TFE resin has finite service life well above the 730°F value of the reference letter.

Reluctant Astronaut

To the Editor:

Rep. Leonard G. Wolf of Iowa report this verse is circulating at the Arm missile center at Huntsville, Ala.:

In the missile game we've won grea fame—
The world knows our Jupiter C
And what we've done with Explorer i
Medaris, von Braun and me.

O watch our smoke as we go fo broke
To solve the space mystery.
We have a thirst to be there first,
Medaris, von Braun and me.

Our skill we pride, we'll travel wid
Into space so wild and free;
To the moon, then to Mars, then t distant stars,
Medaris, von Braun and me.

When finally we've planned a spac ship that's manned,
And they call for brave men, tw or three,
To try first for the moon in tha metal balloon—
Call Medaris and von Braun—NO ME

—Ivan the Terrible

Sincerely,
Jay Holmes,
New York, N.Y.

Oversimplified?

To the Editor:

Your editorial, "Six Lines for th *V-2*," in the March 23, 1959, issue o M/R, tends to oversimplify an acute an complex problem. M/R's Managing Edito Don Perry, in the previous week's issu reported that "there is grave danger tha our military 'spec' writers may be en dangering the nation's defense by ove particularizing their orders to industry. This presents the side of the coin observe by industry.

The six lines defining the operation parameters for *V-2* were written in despe ation. The master plan conceived tha World War II would be won with existin electronics, thereby releasing precious sc entists and engineers for the exploitatio of other fields. Germany, through a cor certed drive at standardization, had re duced the military application of electro tubes to less than two dozen types. It ability to cope with the Allies' advance

lectronics brought Germany to its knees. he frantic introduction of jet aircraft nd the *V-2* came too late.

What is the role and destiny of elec-onics? Electronics is the key to the ıture. Militarily, electronics is the brain overning the muscular reflexes that parry nd thrust the spear and whoever fails to ıaintain the pace is doomed. To hasten ıe pace in obtaining tomorrow's weapons ve have resorted to the weapons system vhich, in respect to Government Fur-ished Equipment (GFE), provides indus-y a relatively unencumbered approach to ıe development and production of the veapon.

Today, our military electronics con-ains in excess of 3000 electron tube ypes. Further, transistors and other spe-ial devices are running amuck. R&D and roduction are in many cases indistin-uishable. While I am generally in agree-ıent with the precept that secondary con-iderations such as logistics support re-uirements shall not obstruct weapons de-elopment, I firmly believe that failure to dequately consider them will cost us early in operational availability, person-el and dollars.

Robert H. Byrne, LCDR, USN
208 Pacific Drive
Forrestal Village
North Chicago, Ill.

Compliment of a Sort

To the Editor:

May I congratulate you on your calm nd intelligent editorial of March 30th. M/R still has a long way to go on reliable eporting, but I now have the confidence hat it will make the grade.

Roy E. Marquardt,
President,
Marquardt Aircraft Co.

Let's Accelerate

To the Editor:

Maj. William C. Mannix's very interest-ng article in your April 27 issue reminds ne of the gag we used to throw around he lab a few years ago:

"Our hero rammed it to the firewall nd accelerated to 17 microluxes."

As you may gather, a microlux is pre-isely Maj. Mannix's "optik." We chose his size for the same reasons he did—t's about Mach 1 and very convenient ll the way round.

I think that it is better to use the speed f light as the basic unit rather than /1,000,000 since no new units are used. n electronics, microfarads have been sed for years with no trouble. They are sually referred to as "mikes," "micro-nikes," etc. Lux actually has another ignificance, so why not name the unit nicrolights, or perhaps, micromannixs?

In any event, don't name it after Einstein—he's wrong.

Robert E. Span,
Ligonier, Pa.

what's happening in Tucson?
GUIDED MISSILE DEVELOPMENT!

A HUGHES-TUCSON ENGINEER puts a new GAR 3 Falcon missile through its paces on the roller conveyor rails of an EGSP console.

With projects underway on new and highly advanced types of guided missiles, Hughes in Tucson offers assignments throughout the entire spectrum of missile research and development.

Hughes-Tucson offers permanent positions to people with the ability and enthusiasm to make major contributions in these areas: missile systems analysis, infrared and radar guidance systems, electromechanical and hydraulic control systems, missile test and handling equipment.

These opportunities for professional advancement are matched by the unique qualities of Tucson as a place to enjoy a fuller life. *(See the advertisement on opposite page.)*

Investigate Hughes...*and* Tucson... today. Send resume to Mr. James W. Kirchhoff at the address below.

Creating a new world with electronics

contract awards

NASA

$24,067,500—**Douglas Aircraft Co., Inc.**, for development of the *Thor-Delta* launching vehicle.

NAVY

$41,200,000—**Bendix Aviation Corp.**, for work on *Talos* guided missiles.

$1,700,000—**Babcock Radio Engineering, Inc.**, Costa Mesa, Calif., for remote guidance systems for shipboard control of missile target aircraft.

$1,225,000—**Summers Gyroscope Co.**, Santa Monica, Calif., for gyroscopic units for guided missiles, mainly for spring-wound gyros for use in *Bullpups* (subcontracts from The Martin Co.).

$729,662—**American Bosch Arma Corp., Chicago Div.**, for *Talos, Tartar* and *Asroc* missile switchboards and weapons direction equipment action cutout switchboard.

$658,965—**Lansdowne Steel & Iron Co.**, Morton, Pa., for *Zuni* rocket heads and other items.

$320,000—**Ralph T. Viola**, Oxnard, Calif., for construction of missile handling buildings at Naval Missile Center, Point Mugu.

$144,998—**United Aircraft Corp., Norden Div.**, for synchros.

$44,956—**Thompson Ramo Wooldridge, Inc.**, for interference generators.

$43,000—**Massachusetts Institute of Technology**, for alloy development program based on chromium for use at elevated temperatures.

$33,300—**University of California**, for investigation of feasibility of shaping ductile ceramics by methods involving plastic flow.

$32,015—**Bendix Aviation Corp., Montrose (Pa.) Div.**, for synchros.

$30,398—**Collins Radio Co.**, for research on high-speed wingless VTOL aircraft.

ARMY

$8,671,100—**Western Electric Co., Inc.**, for supplemental R&D on *Nike-Zeus* system.

$1,131,680—**Kaminer Construction Co.**, Chamblee, Ga., for construction of dessicant drier system for the Propulsion Wind Tunnel, Arnold Engineering Development Center, Tullahoma, Tenn.

$1,000,000—**Temco Aircraft Corp.**, for wings and elevons for the *Hawk* missile (a follow-on order from Raytheon manufacturing Co.).

$750,000—**Allied Chemical, General Chemical Div.**, for research on high-energy oxidizers for advanced solid rocket propellants.

$709,656—**McDonough Construction Co. of Florida**, Miami, for construction of buildings and utilities at Eglin Gulf Test Range.

$313,276—**Western Electric Co., Inc.**, for *Nike* spare parts and components (three contracts).

$250,000—**Standard Construction Co.**, El Paso, Tex., for construction of telephone cable plant at White Sands Missile Range.

$216,369—**Raytheon Manufacturing Co.**, for electron tubes (four contracts).

$174,818—**Minneapolis-Honeywell Regulator Co.**, for components for *Honest John* adaption kit.

$151,254—**Tung-Sol Electric Co.**, Newark, N.J., for electron tubes (two contracts).

$128,775—**Kuthe Laboratories, Inc.**, Newark, N.J., for electron tubes.

$100,930—**McGregor-Michigan Corp.**, Detroit, for a complete tunnel, arc chamber and related steel structures for the Propulsion Wind Tunnel, Arnold Engineering Development Center, Tullahoma, Tenn.

$99,068—**Motorola Inc.**, Phoenix, for nine months' continuation of studies of automatic plot of enemy signal origin point.

$85,240—**C. F. Mayer & Co.**, Bethel Park, for construction of warheading buildings for special AAA facilities for Cincinnati Defense Area.

$67,442—**W. R. Grace & Co., Dewey & Almy Chemical Div.**, Cambridge, Mass., for a meteorological balloon.

$61,000—**Belock Instrument Corp.**, College Point, N.Y., for fabrication of engineering test models of computer-driven reticles for articulated telescope T17I.

$58,443—**Union Carbide Corp., Union Carbide Chemicals Co.**, for ethylene oxide in government-furnished steel cylinders.

$52,780—**General Electric Co.**, for electron tubes.

$47,959—**Belock Instrument Corp.**, for design, engineering and fabrication of six integrating gyro assemblies.

$45,700—**Cohu Electronics Inc., Kin Tel Div.**, San Diego, for a closed circuit television system for the White Sands Missile Range.

$40,695—**The Eagle-Picher Co.**, Cincinnati, for thermal batteries.

$34,850—**Kearfott Co., Inc.**, for motor generators.

AIR FORCE

$33,175,558—**International Business Machines Corp.**, for transistorized support machine computers for SAGE air defense system.

$11,400,000—**ITT, Federal Div.**, Clifton, N.J., for duplex high-power radio amplifiers to be used in the SAGE network.

$6,859,000—**S. Patti Construction Co., Mac Donald Construction Co., C. H. Leaver Co., and Scott Co.**, Kansas City, Mo., (joint venture) for construction of launch and service buildings for missile launch complex in the vicinity of Spokane, Wash.

$3,000,000—**Chrysler Corp.**, for *Jupiter* ground support equipment.

$2,000,000—**Curtiss-Wright Corp., Metal Processing Div.**, for acquisition of machinery and equipment.

$1,637,887—**Litton Industries, Electron Tube Div.**, for electron tubes.

$636,713—**Pan American World Airways, Inc.** for increase in funds (for Patrick AFB).

$500,000—**Ryan Aeronautical Co.**, for technical support of the GC-130A Drone Launcher/Director aircraft development program.

$249,300—**Microwave Associates, Inc.**, Burlington, Mass., for electron tubes.

$197,365—**Radiation, Inc.**, Melbourne, Fla., for development of computing-tracking group.

$167,452—**General Electric Co., Defense Electronics Div.**, for telemetric data monitor.

$120,050—**Minneapolis-Honeywell Regulator Co., Heiland Div.**, Dayton, Ohio, for oscillographs, visicorders, subminiature galvanometers and manuals.

$111,153—**Hewlett-Packard Co.**, Palo Alto, Calif., for signal generators.

$91,784—**Haloid Xerox, Inc.**, Rochester, N.Y., for research on high-temperature complex component development.

$78,000—**Bendix Aviation Corp., Red Bank Div.**, for electron tubes.

$73,189—**Del Mar Engineering Laboratories**, Los Angeles, for infrared-emitting aerial tow target.

$65,500—**Sperry Rand Corp., Remington Rand Univac Div.**, for floating paint for Univac computer modification in support of Project WS-133A.

$60,125—**Avien, Inc.**, Woodside, N.Y., for product improvement on time-temperature integrators.

$59,357—**AVCO Manufacturing Corp., Research and Development Div.**, for multiple path photoelectric projectile detector and shadowgraph photograph system.

$58,317—**General Electric Co.**, for research toward study of radiation damage thresholds of the elements.

$54,695—**Boston College**, for research on collection, reduction and evaluation of geomagnetic field data and electric field phenomena, atmospheric and terrestrial.

$54,177—**Republic Aviation Corp.**, for determination of orbital motion of the Russian Satellite 1957 Beta.

$51,646—**General Electric Co., Research Laboratory**, for research on development, test and fabrication of sun-azimuth pointing platform.

$40,000—**Battelle Memorial Institute**, for continuation of research on effect of very high pressure and temperature on semiconducting and insulating materials.

$39,848—**Lightning & Transients Research Institute**, Minneapolis, for propagation studies using VLF impulses, to include ground wave and ionospheric studies.

$35,000—**University of Colorado**, for study of reflection and transmisison of materials for radiation in the far ultraviolet.

. . . What This Important News Means to You!

"Up to now, I've only dreamed of being able to use *pure* tungsten . . . now it's a reality." This is a typical reaction to the news of Fansteel's breakthrough in the fabrication of tungsten.

It opens endless possibilities for using tungsten in any number of products—whether it's a spectacular missile, or a down-to-earth consumer item. Now . . . tungsten—with its melting point of 6152° F., highest of all metals, with its terrific strength at high temperatures, with its outstanding density of .697 lbs./cu. in.—can be exploited to the fullest.

FANSTEEL

HIGH TEMPERATURE METALS

Because Fansteel can now fabricate *pure* tungsten into almost any conceivable shape by spinning, deep drawing, hot extrusion or forging, the design engineer can count on tungsten . . .

—for greater reliability and longer life
—for even greater miniaturization
—for highest strength at extreme operating temperatures

Want to explore the possibilities of adapting tungsten to *your* product? Fansteel engineers will be glad to work with you. Just send print, part sample or call in your Fansteel representative.

Only your imagination will determine what lies ahead in the uses of tungsten.

K593

FANSTEEL METALLURGICAL CORPORATION, NORTH CHICAGO, ILLINOIS, U. S. A.

Three officials of Aerojet-General Corp. have been tapped by the National Aeronautics and Space Administration for its Research Advisory Committees. **Dr. A. L. Antonio,** vice president-Chemical Division, will serve on the Committee on Chemical Energy Processes; **Gordon Banerian,** manager, Turbo-Machinery Division, on the Committee on Mechanical Power Plant Systems, and **Lawrence L. Gilbert,** head of the Materials Department, will head the Committee on Materials.

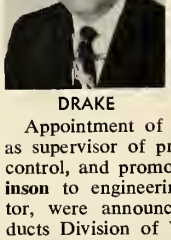
Three new Aerojet appointments:

Dr. Adolph Oberth, 30, son of pioneer rocket expert **Hermann Oberth,** has joined the solid-propellant research and development staff to work on high-energy propellants. Oberth, who has always wanted to follow in his father's footsteps, came to the U.S. in 1946 with a PhD in chemistry from the Institute of Technology at Munich and worked for DuPont in New Jersey.

Dr. Robert F. Brodsky, who once designed the configurations for America's atomic and hydrogen bombs, will be Systems Division Manager, Engineering Services Department. Before joining Aerojet, he was chief of aerodynamics at Convair, Pomona, Calif.

Rear Adm. L. C. Baldauf, USN (Ret.), former director of Quality Control for the Navy's Bureau of Ordnance, was named technical specialist on the corporate quality control staff.

Dr. Stanley Winkler has joined the Technical Planning Staff in Advanced Systems Research at the International Business Machines Corp.'s Military Products Division. Winkler was chief, Command Control Systems of the Office of Naval Research, where he directed a study of the influence of satellites and space technology on naval operations. He also led a group which evaluated missile guidance systems and conducted an investigation of inertial navigation systems.



WINKLER

Robert H. Shatz has been named chief of technical military planning in United Aircraft Corp.'s Missiles and Space Systems division. Director for the past ten years of the Systems Research Division of Cornell Aeronautical Laboratory, he has served on Pentagon study groups involving the missile defense program.

At the same time United announced that its second George Mead Medal for Engineering Achievement went to **Thomas Richard Quermann,** chief gyro engineer of the Norden division's Ketay department. The medal and $2500 were awarded for Quermann's conception of a unique liquid-floated gyro with mechanical temperature control, and his preparation of the design for production in less than a year. A major step in development of gyros for missiles and space craft, it is now used in the *Atlas, Titan, Polaris* and *Snark* programs.

Dr. Burton H. Colvin heads the Mathematics Research Laboratory at Boeing. Colvin succeeds **Dr. Robert E. Gaskell,** who resigned to accept a post as mathematics professor at Oregon State College. Colvin joined Boeing as a mathematician in 1951 and was appointed supervisor of the mathematical analysis group in 1955.

John A. Drake, director of ASTRO, a division of Marquardt Aircraft Co., has been appointed to the Research Advisory Committee on Chemical Energy Processes of the National Aeronautics and Space Administration.

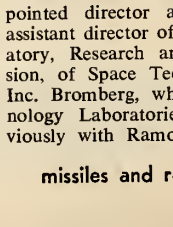
DRAKE

Appointment of **Howard E. Thompson** as supervisor of production planning and control, and promotion of **James R. Robinson** to engineering services administrator, were announced by Technical Products Division of Waste King Corp. For the past ten years Thompson was chief inspector, quality control manager and product engineer for National Seal Division, Federal-Mogul-Bower Bearings, Inc. Prior to joining Waste King, Robinson was assistant to the director of plant operations at Marquardt Aircraft Corp.

Alfred C. Harris has joined Commercial Shearing and Stamping Co., Youngstown, Ohio, as sales manager for Roto-form products, a new metal-forming service. Harris came to Commercial from the Metal Dynamics Division, Cincinnati Milling Machine Co.

HARRIS

Robert O. Briggs was recently named Chief Engineer of the Electronics Division, United ElectroDynamics, Inc. He was formerly with the missile system consulting firm, Robert Briggs Associates, Inc.



Richard S. Morse, Cambridge, Mass., newly-named Director of Army Research and Development, will succeed **Dr. William H. Martin,** effective June 1. Morse is founder and president of The National Research Corp., Cambridge. His new job carries authority equivalent to an Assistant Secretary of the Army.

Maj. Gen. T. C. Odom (USAF Ret.), IBM's new director of systems management for the Military Products Division, was until recently commander of the San Antonio Air Materiel Area.

Louis A. Payne has joined Lear, Inc., Astrionics Division, Santa Monica, Calif., as manager of its Engineering Division. For the past eight years he was senior dynamics group engineer with Convair Division of General Dynamics Corp., in charge of flight control system analysis, synthesis, lab development and flight test development.

Robert E. Rutherford and **Bernard R. Linden** have been named manager and assistant manager, respectively, of the Vacuum Tube Section of CBS Laboratories' Physics Department.

Eldon Overholtzer, corporate secretary of Tamar Electronics and Pres-To-Line Corp. of America, was appointed to the newly-created position of executive vice president for both organizations. Overholtzer was named general manager and secretary-treasurer in 1948, and assumed corporate responsibilities when Pres-To-Line acquired Tamar.

OVERHOLTZER

Dr. Robert Bromberg has been appointed director and **Arthur F. Grant** assistant director of the Propulsion Laboratory, Research and Development Division, of Space Technology Laboratories, Inc. Bromberg, who joined Space Technology Laboratories in 1958, was previously with Ramo-Wooldridge Corp.

CREATIVE MINDS NEEDED to explore new fields in Space Age Electronics. Join one of the fastest growing engineering and scientific organizations in the new field of Space Electronics. Thus far, Hallamore has had a remarkable participation in nearly all of the space frontier programs... some of which are: 1. Development and manufacture of 4 tracking and telemetering stations for Explorer satellites. 2. Development and manufacture of 6 tracking and telemetering stations for United States Air Force lunar probe. 3. Development and manufacture of 4 tracking and telemetering stations for United States Army lunar probe. 4. Ultra-sensitive receivers for atomic cloud propagation studies. 5. Airborne reconnaissance TV system. 6. Underwater electromagnetic wave communications studies. 7. Automatic checkout equipment for space missiles. Such programs are on contract, and equipment is in field operation at the present time. If you have a highly creative mind, with an educational background of BS to PHD and an active interest in theory, circuit development, or project engineering, we invite you to join our outstanding team, to search into the future and to share in the rewards of Hallamore's dynamic growth. For further information, please write or call: Frank W. Lynch, V.P. Engineering, Hallamore Electronics Company, 8352 Brookhurst Avenue, Anaheim, California / Prospect 4-1010 : a division of The Siegler Corporation.

HALLAMORE

ropulsion engineering

Hydrazine formation from ammonia now can be more clearly derstood, thanks to University of Utah chemists who have defined e processes that occur in ammonia under high-frequency discharge. ney also report, in the journal *Industrial & Engineering Chemistry*, e controlling factors in producing hydrazine from ammonia, and relationship between the nature of the spark and the amount of is decomposed by it.

Maximum hydrazine yield is about 4-6 grams/kilowatt hour. actors which control the yield are gas flow rate, pressure, discharge rrent and electrode gap size. The work was done by W. Hoyt nderson, now with Aerojet-General; B. J. Zwolinski, currently at arnegie Tech; and R. B. Parlin, now with Operations Research, c. Understanding and possible control of the mechanism of hydra-ne's direct synthesis from ammonia could lead to wider availability id drastic price reduction.

Hydrazine makes news in Germany, also, as Farbenfabriken ayer reveals a new process for recovering the material from lean ater solutions. The patented technique pulls hydrazine from solu-ons containing as little as 1% hydrazine by weight. German chemists ix the water waste with cyclohexanone, precipitating dicyclohexyli-ene hydrazine. An acid then splits off the corresponding hydrazine lt from which hydrazine is released by action of a hydroxide. In ractice, the Germans say, the technique is simple and cheap—and l hydrazine can be recovered.

Transistors operate at 1800°F in an inert or reducing atmos-here, 1480°F in air, when they are made of boron phosphide. So eported Monsanto Chemical's Forrest V. Williams at the recent Amer-an Chemical Society national meeting. He also revealed a way to repare the high-purity boron phosphide by reacting boron trichlor-le, phosphorus, and hydrogen at a high temperature. Most present ansistors are germanium or silicon. Germanium works at tempera-ures up to 160°F, silicon up to 300°F. Boron phosphide is a very ard, refractory-like material which is not attacked by most corrosive gents.

Cheaper titanium will result from a new process developed by rmour Research Foundation. The key is a cold chlorination of wer-grade ilmenite ores and crude scrap. This produces the actual arting material—potassium chlorotitanate. From this, ARF can roduce not only the metal, but also two other major products: titan-um dioxide and titanium tetrachloride. Besides using low-grade ores nd scrap, and producing three needed items from one starting ma-rial, the process also may result in cutting other in-plant costs. This just a continuation of research that is gradually lowering the price f this corrosion-resistant metal. Titanium now sells for around 1.85/lb. A year ago it was $2.25, and five years ago it sold for 5.00.

Beryllium prices may head down, also, again thanks to a new search development. Sylvania-Corning Nuclear Corporation has de-eloped a continuous process for beryllium amalgam production. he process, still in the laboratory stage, is a simpler and more direct oute to the metal than techniques used at present. Sylvania's Be-malgam is produced continuously by electrolysis. In present industry ractice, beryllium fluoride is reduced by magnesium to tiny metal alls which must be ground and then fabricated by powder metallurgy chniques. With the new process, beryllium shapes can be made irectly from the amalgam.

A Personal Invitation to

ENGINEERS

from ROBERT McCULLOCH

President

"If you would like to be a member of a select corps of Engineers, working for an interesting, growing company . . in one of the country's most stimulating areas . . I invite you to write to Temco. Temco's growth is sound and planned, its products are diversified and challenging, our facilities are modern. Every benefit, for you professionally and in good living for you and your family, is here. Below are some of the areas in which jobs are open now."

ANTENNA DEVELOPMENT

Graduate Electronics Engineer or Physicist to perform analysis and design of antenna, microwave, and propagation systems for use in missile guidance and reconnaissance. Individual will be responsible for performing investigations in new types and concepts of transmitting and receiving antennas for both pulsed and CW signals, and the adaptations of these studies to current use in Electronic Development projects.

SENIOR FIELD SERVICE ENGINEER

Openings exist for a graduate Electronics Engineer with five years' experience in radar systems development, to be responsible for technical assistance and maintenance of Temco hardware in the field. Recent industry or military electronics experience with any of the following types of radar equipment is necessary. APS-20E, APS-45, FPS-20, FPS-8, FPS-6, MPS-11. The Field Engineer will coordinate the operation and application of the equipment to field uses with the Engineering Development sections.

west coast industry

by Fred S. Hunter

The California Assembly has passed the bill which will make i possible for counties to tax machines or materials owned by th Federal Government but used by defense plants. The chances ar better than 50-50 that the Senate will concur and something like $35 million in property will go back on the tax rolls.

There are two sides to the question of exempting Federal propert in defense plants from local taxes. Take, for example, Convair-Astro nautics' plant at San Diego, for which the government supplied mos of the machinery and equipment. The City of San Diego can't ta this government property, but it was faced with finding the money t build new access roads to the plant to serve the employes.

On the other hand, any local taxes Convair-Astronautics migh have to pay on this government-owned property would be reflecte in increased costs of the *Atlas* missile. And the Air Force, conceiv ably, could tell Astronautics it would have to go someplace els where taxes are lower, to build the ICBM.

Most tax people seem to feel that once the legalities of the posse sory interest tax are spelled out in California other states will follo suit and a more-or-less uniform formula eventually will be applie throughout the country. But there is also the chance that some state may seize this as an opportunity to attract defense business to the borders.

One Assemblyman, seeking to amend the tax bill to soften th effect, argued that the tax would drive defense industry from th state. It won't be this bad, but there's no doubt that the dollar amou is big enough for consideration in evaluating a contract price or th location of a plant. At the going rate of the defense industry in Cal fornia, the law change means a tax boost of approximately $20 mi lion a year.

Radioplane's contract from McConnell Aircraft Corp. for desig development and test of a landing system and post-landing equi ment for the man-in-space capsule, Project *Mercury*, calls for 2 units. This division of the Northrop Corp. also will provide eig landing and recovery units for the National Aeronautics & Spa Administration for early space age tests. It is interesting to note th Radioplane's approach to the problem is simple and straightforwar It has been developing recovery systems for drones for years and i engineers know the lines to follow.

Douglas Aircraft Co. makes most of the ground equipment f the *Thor* IRBM—including the shelters which roll automatically wheels mounted on tracks—at Long Beach, where it has big hanga rather than at Santa Monica, where the missile itself is assemble The shelters, which cost $286,000 each, contribute a large share the Air Force's airlift of the *Thor* to the United Kingdom. They' shipped in prefab form and weigh 100,000 pounds each.

Willis M. Hawkins, assistant general manager of Lockheed's M sile and Space Division, is another who feels it wise to keep t public informed on missile and space projects. Only in this way, says, will voters learn to appreciate the need for these projects a understand the reasons behind their huge costs.

Use of North American Aviation's Rocketdyne facilities for bac ground in a Desilu Production film prompted local speculation fo new TV series titled "I Love Liquids."

Adam Makes Comeback in *Mercury*

by Paul Means

WASHINGTON—A governmental axm of long standing is that a project jected one year may be accepted the xt if submitted to a different governental agency in a slightly different ay.

This certainly is the case with the rmy's Project *Adam* man-in-space nture, (M/R, June, 1958, p. 40) hich was turned down cold by the epartment of Defense last year, but hich now forms the nucleus of the ational Aeronautics and Space Adinistration's Project *Mercury*.

Under Project *Adam*, the Army ould have sent an astronaut 100 miles in a ballistic missile trajectory with *Redstone*, and brought him back to rth with drogue parachutes.

Planning on *Adam* began in the all of 1957, but was turned down by OD last summer because the *X-15* cket plane would have been ready about the same time.

Now NASA's Project *Mercury* has corporated Project *Adam* as one of preliminary steps.

After the *Mercury* space capsule as been aerodynamically tested on top the four Thiokol *Sergeant* rocketustered *Little Joe* vehicles, it will tested on top of a modified *Redone* with animal passengers over the tlantic Missile Range.

The seven *Mercury* astronauts could ke their *Redstone*-powered rides down e Atlantic Missile Range as early as nuary, 1960.

• **Reliable** *Redstone*—*Redstone* was riginally picked for Project *Adam* nd subsequently selected for Project *Mercury* because of its proven reliility.

The modified *Redstone* (*Jupiter-C* nfiguration, minus the upper staging rrangement and Hydyne fuel) will ave approximately a 4500 to 5000 et/sec. velocity at power cutoff when e nose section separates.

The *Redstone* will carry its passngers to an altitude of 100 miles and 00 miles down range.

The capsule will come to a near andstill at the apex of its ballistic tractory, gaining a speed of about 5000 et/sec. when it re-enters the atmosere. Two or three automatic drag arachutes will slow the capsule down nd a parachute will be deployed at an titude of 7000 feet. The capsule's tro-rockets will be fired for test purses only.

Redstone will subject the astronaut at least six minutes of combined gative g's and complete weightlessss. Total flight time from launch to return to earth will be from 10 to 12 minutes.

• **Test plans**—First *Jupiter* firings of the capsule, which is the next step in Project *Mercury* development, could come by the end of 1959. These shots are to test the aerodynamic qualities of the capsule and the reliability of the retro-rockets at velocities approaching those to which the *Atlas* vehicle will subject the capsule.

Final testing before manned flight will be with the *Atlas* launcher itself. The capsule will be sent into orbit and recovered, alone and with animals, many times before man will be sent along as its passenger.

• **Actual flight**—The manned capsule will be launched at Cape Canaveral into an orbit with an inclination of about 30 degrees north of east. (See M/R, Nov. 10, 1958, p. 14.)

The escape system, consisting of forward thrust vernial rockets and support framework, will be ejected after separation of the *Atlas* nose cone instrumentation from the booster section. Orbit will be almost completely circular with an apogee of 120 nautical miles and a perigee of 110 nautical miles.

The astronaut will be traveling forward during the accelerating phase of the flight and backward during the reentry deceleration phase. A heavy metal shield at the passenger's back will absorb or radiate the aerodynamic heat of re-entry.

• **Controls**—Attitude (pitch and yaw) and roll jets will position the capsule for proper re-entry. They can also be operated manually by the astronaut after re-entry.

The retro-rockets will be fired at the beginning of the re-entry path, or during ascension if it is determined that the booster will not reach orbital speed.

When the capsule has decelerated to a velocity of Mach 1, a drogue parachute will be deployed to provide additional dynamic stability.

Two landing parachutes will be provided in case one should fail. The first will be deployed at an altitude high enough to allow time for the deployment of a second if necessary. Sinking speed will be 30 feet/sec. with a theoretical impact altitude of 5000 feet.

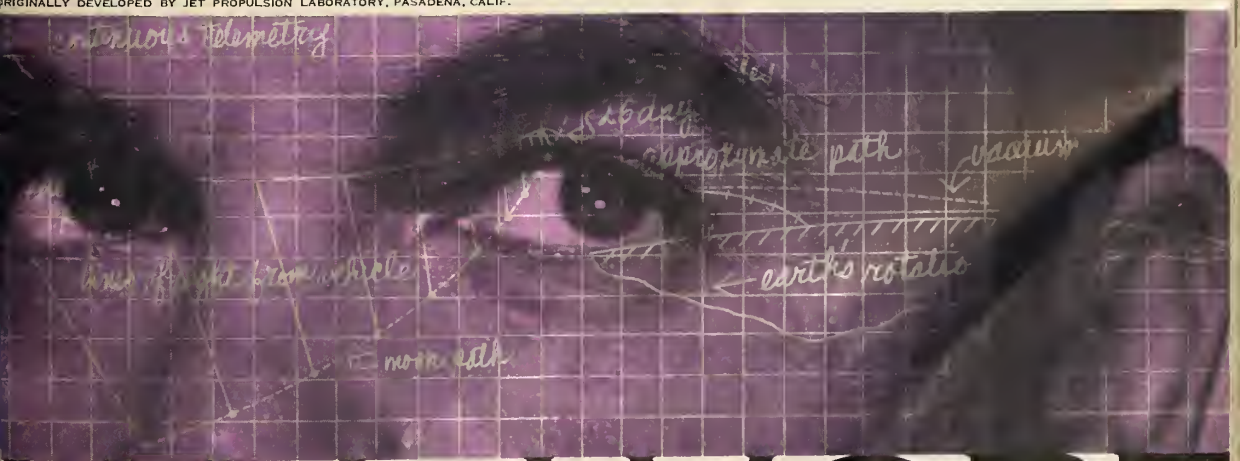
Convair
and the ages
we live in

JET AGE • MISSILE AGE
SPACE AGE • ATOMIC AGE

In this era that probes beyond all scientific horizons, the Convair division of General Dynamics Corporation has attained famous firsts in all four areas. **JET AGE:** B-58, first supersonic bomber. **MISSILE AGE:** Atlas, our first Intercontinental Ballistic Missile. **SPACE AGE:** The world's first ICBM to be placed in orbit. **ATOMIC AGE:** Convair was first to make tests on a nuclear reactor carried in flight.

Convair, as a member of the General Dynamics industrial family, is assisting to assure world peace and expanded scientific knowledge in the four ages we live in—an era unequalled in all of history!



CONVAIR

A DIVISION OF **GENERAL DYNAMICS CORPORATION**

ITELLIGENCE—Hallamore Microlock* provides the all-important link of intelligible communication between space hicles and earth. Six Hallamore developed Microlock tracking stations monitor positions and receive intelligence from nguard and Explorer satellites...stand watch, with full capability, on U.S. Airforce and U.S. Army Lunar Probes. Micro-k "locks" on fractional signals from tiny transmitters to bring in messages free of noise distortion. Hallamore developments audio-visual telemetry, versatile automatic checkout systems, and guidance are speeding man's mastery of missilry and ace technology. For systems capability, plug-in building blocks and C.C.T.V., write Hallamore Electronics ompany, 8352 Brookhurst Avenue, Anaheim, California / TWX: AH 9079: a division of The Siegler Corporation.

RIGINALLY DEVELOPED BY JET PROPULSION LABORATORY, PASADENA, CALIF.

HALLAMORE

Proved! New, Better Way to Seal Drilled Holes with . . .

Less weight!

Less cost!

NEW **PIN-PLUGS**°

Seal simply, positively Prevent costly leaks!

Now — forget conventional, costly methods of sealing holes that serve as flow or pressure passages. The Lee "Pin Plug" is a cylindrical plug with a tapered reamed hole partway through its center and numerous small grooves on its outside surface. Simply place it into reamed hole and drive in the tapered pin until ends are flush. Controlled expansion causes grooves in plug to "bite" into casting and form independent seals and retaining rings. Extensive laboratory tests report no leaks under normal pressures, often show bone dry seals up to pressures of 40,000 psi.

Now successfully and widely used on aircraft and missiles — for pumps, servo valves, regulators, etc. Available steel and aluminum and in both long and short series.

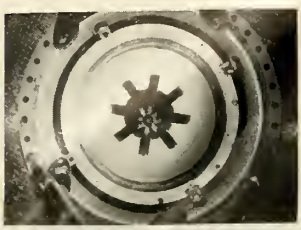
COVER: Gyrations of ballistic missile flight are re-created at Avco in a three axis flight simulator.



AMMONIUM perchlorate aluminized propellant was used in Astrodyne's Project "GO" unit which utilized XM-34 case.

SOME 45,000 pounds of thrust was produced in the 16' x 27" diameter case which had 40 times more propellant than any previous Astrodyne cast motors.

STAR-SHAPED steel mandrel, coated with Teflon to act as lubricant, is inserted in rocket case.

AP aluminized propellant made it possible to pour directly into 13-foot case without benefit of rubber liner.

Now! Cool through the thermal barrier with FLAMEMASTIC!

The high-heat insulating *material proved* in *actual production* for *4 years*

Now, you can provide positive protection and high-heat insulation for metal surfaces with FLAMEMASTIC. For four full years, FLAMEMASTIC has been used exclusively on one of the major production missiles. And it has been applied extensively in other experimental firings of rockets and missiles and on allied test and launching equipment.

FLAMEMASTIC protects against high-velocity combustion heats, ranging from 3000°F. upward. This insulation provides positive protection for vital electronic equipment.

FLAMEMASTIC is readily applied by conventional application methods.

Concurrency—Prime Need in Pentagon

Lt. Gen. Bernard Schriever took command of the USAF Air Research and Development Command on orders dated April 29 and the same week appeared before the Senate Space Committee and took a few healthy swings at the Defense Department's Advanced Research Projects Agency (ARPA).

Schriever, who is at least as knowledgeable on the subject of missiles and spacecraft as anyone else in the country, told Congress he had always been opposed to establishment of an operating agency on the Secretary of Defense level; that ARPA had not delayed the military space development program as of the present time, but that if ARPA continued to operate in its present fashion a delay would certainly come when the space systems were turned over to the military for operation.

He based his arguments and his logic on the established premise of "concurrency," which he explained thusly:

"A weapon system consists of much more than the hardware which is developed and tested. It also consists of the industrial base required for its production, the operational facilities for its operation and maintenance, the command communications system for its operational control, the supply and transportation system for its support, the training facilities and the instructors, and finally the people organized and trained to operate and maintain the weapon."

Military space systems require the establishment of a complete new operational environment. None of the above-mentioned weapon system elements, for instance, were in existence when work began on the *Atlas* and the *Titan* programs. Under the concept of concurrency, however, each element of the total weapon system was integrated into a single plan. Operational and training bases for both *Atlas* and *Titan* were under construction prior to the test launch of the first missile. So was the training program—and the logistic support program.

The ARPA method of operation pretty well precludes such concurrency. ARPA, conscious that its original mission was to stop the rivalry between the services, divided every military space project between the services. Army may have guidance, Navy tracking and the Air Force propulsion. Then, when the device is properly developed, it will be turned over to the service most needing, best suited, most vocal—or what not.

The trouble with that is that it will then take the service which gets the device two more years to develop the supporting elements required for its usage—the supporting elements which should have been developed concurrently.

General Schriever expressed some doubt that the ARPA system was best for the country. He is not alone in this feeling. The R&D civilian chiefs of all three services share it to a greater or lesser degree. All three of them, incidentally, have recently left or are leaving the Pentagon.

In 1958 A. Blagonravov, a member of the USSR Academy of Sciences, wrote: "It is easy to see that precisely the time element is the decisive factor which should be grasped in the competition with the capitalist countries in the field of technology."

The Rockefeller Report stated: "A nation can achieve a basic advantage if it is able either to develop or to produce weapons more rapidly than its opponents. One of the major weaknesses in our strategic posture has been our inordinately long lead-time."

And, the Von Neumann committee in recommending how to speed up the U.S. missile program said that the *pacing item* in the program would be not technology but organization, management and administrative procedures.

Somewhere in the last few years the Office of the Secretary of Defense has come to have a greater regard for procedures than for action, for form rather than result. There are too many directorates, too many committees, too many offices that exist—Heaven knows why.

Even the Joint Chiefs of Staff have fallen prey to a lethargy of indecision. More and more questions going there result in split decisions—and the matter is referred to a study group.

Maybe it is indecision, maybe it is politics. Whatever or why ever, the result is to drive a lot of good men out of the Pentagon in pure frustration and to impair speed of action when such speed is vital.

Hughes in Southern California

announces the establishment of

a major new division . . .

the COMMUNICATIONS DIVISION

The growing importance of global and space communications, together with major contributions of the Hughes Communications Laboratory, such as the Long Arm (AN/URC-15) and Quicksilver (AN/URC-23) programs, has resulted in the creation of the COMMUNICATIONS DIVISION of the Hughes Aircraft Company. The new division is fully integrated and will be responsible for communications research, development, manufacturing and sales. Expansion plans are ambitious and aggressive, and the backlog of contracts already awarded promises an expansion consistent with the spectacular records established by the other major divisions of Hughes Aircraft Company.

The establishment of Hughes as a major factor in the communications industry has created many openings for experienced electronic engineers in the following areas:

Senior Staff Engineers

Transistor Circuit Design

RF Power Design

Digital Data Processing

Communication Systems Analysis

also

Communications Project Engineers

Propagation Specialists

washington countdown

IN THE PENTAGON

ARPA scientists hope to install a backstop device in *Discoverer III* to insure that its capsule bearing four black mice is ejected at the right time over the Pacific. A temporary failure of the timing device in *Discoverer II* prevented it from ejecting its mouse-less capsule at the right time last month.

• • •

Discoverer III—scheduled to be launched the end of May—will carry the four mice in the same kind of capsule used in *Discoverer II*. The Air Force also plans to use the same method to attempt recovery—C-119's equipped with trapeze nets.

• • •

This summer will see the greatest shift of Air Force general officers ever. Thirty-five will retire. The Pentagon development office (DSC/D) will be particularly affected by the changes and by the fact that the Directorate of Requirements was transferred from Development to Operations last week.

• • •

Maj. Gen. James Ferguson, who was Director of Requirements and moved with the office, will be transferred soon. Maj. Gen. Leland Stranathan, Director of Development Planning, will also be transferred. Maj. Gen. Donald J. Keirn, assistant C/S Development for Nuclear Systems, will retire. So will Brig. Gen. Don Zimmerman, assistant for Foreign Development. Maj. Gen. Ralph Swofford, assistant deputy C/S Development, is also scheduled for transfer this summer.

ON CAPITOL HILL

House Democrats appear to be adopting a strategy aimed at both eating and having the space program cake. Under the strategy, they'll just about give the Administration what it wants to spend on space—but no more. (This avoids the charge that they're spenders.) Then, if Russia makes a new sensational jump into space and a public howl goes up for action, the Democrats will be in a position to appropriate—and investigate.

• • •

The Senate Military Construction Subcommittee is certain to take up the invitation of Defense Secretary Neil McElroy to help resolve the rivalry between the Boeing *Bomarc* and Western Electric's *Nike-Hercules*. Moreover, the bets are heavy that the subcommittee headed by Sen. John Stennis (D-Miss.) will recommend that *Nike-Hercules* be curtailed in favor of *Bomarc*.

AT NASA

Space program planners are preparing for the not far distant future when the skies will be crowded with satellites. NASA has contracted to install an IBM 709 computer at the IBM-*Vanguard* Computing Center in Washington where a less advanced 704 has been computing the orbits of almost all U.S. satellites. NASA also has contracted for two even more advanced IBM 7090's—probably for use at the NASA Space Center planned for nearby Greenbelt, Md.

• • •

The NASA 704 can handle 42,000 operations a second. It could compute and predict orbits for 10 to 20 satellites simultaneously. The 709 operates three times as fast and could handle about 60 satellites. The 7090 is about five times as fast as the 709.

• • •

The current rumor that NASA Chief T. Keith Glennan will leave his post after his first year and that AF Assistant Secretary for R&D Richard E. Horner is being brought in to replace him apparently is not true. Glennan's friends say he intends to remain until the end of the Eisenhower Administration. Horner is being brought in as general manager, giving NASA the type of organization which Glennan favors and worked with when he was an AEC Commissioner.

• • •

Reason for the Venus probe cancellation was that STL tried to do too much too soon in integrating 13 major experiments into the "paddle wheel" payload of *Thor-Able III*. After *Thor-Able III* is eventually shot into its 30,000-150 mile orbit, the former Venus probes—*Thor-Able IV* and *Atlas-Able IV*—will be shot into deep space. With their improved solar cells, they will be tracked further than any previous payload (M/R April 27).

AROUND TOWN

The British are reported having trouble transporting their liquid *Blue Streak* IRBM to the Australian Woomera Missile Range for testing. Indian Prime Minister Nehru is understood to have refused to allow British planes carrying the missile to land in India on grounds it would affect Indian relations with Russia. Therefore, the British are extending the RAF field at Gan in the Maldive Islands south of India and will use it as the main staging area for missiles being flown to Australia.

...NEWS IS HAPPENING AT NORTHROP

Demonstrating the platform of LINS – new, Lightweight Inertial Navigation System – is Dr. William F. Ballhaus, Vice President and General Manager of Nortronics.

NORTRONICS REVEALS LINS... COMPLETE PRECISION INERTIAL NAVIGATION SYSTEM!

A recent demonstration at Nortronics' Guidance Symposium revealed the most advanced precision inertial guidance system ever assembled. LINS – Lightweight Inertial Navigation System – includes platform, platform electronics, environmental control and computer. Total system weight: slightly in excess of 100 pounds. Equipment volume: less than three cubic feet.

Actual working hardware, LINS is a complete, precision system for automatic navigation applications to advanced aircraft, drones, missiles, and space vehicles. It is ready now – the latest result of Nortronics' more than twelve years of creative research and production in the field of automatic guidance and navigation systems.

If you have the need to know more – contact Nortronics today, regarding LINS for your own system requirement. Nortronics' experience offers unique and proven capabilities in tailoring the design, development and production of complete and integrated guidance systems to your requirements.

industry countdown

STRUCTURES

Douglas Aircraft Company has won an Air Force contract to "design" an ALBM as exclusively reported by M/R last week. No contract figures were released. Under the contract, Douglas is to come up with a design and cost study within six months. Douglas expects to let some subcontracts in the six-month period. The Air Force chose Douglas over nearly two dozen other firms, some of which had conducted experimental test launchings.

• • •

Beef-up of Tactical Air Command is in the works as the result of hush-hush TAC R&D survey showing 17 well-placed Soviet 1-megaton warheads could knock out all NATO missile emplacements in West Germany hardened to less than 5 psi. Contract for design in a hurry of underground sites for Martin's *Mace*, now 1000-mile plus near sonic surface-to-surface nuclear missile being deployed to Germany, is in the hands of Grad, Urbahn & Seelye, A&E firm. *Mace* base concept is expected to permit multiple launching from hillside caves, plus firing from enclosures where acoustics are a primary problem. Hardening of other TAC missile launchers including all presently deployed and expected-to-be-deployed missiles may follow shortly.

• • •

First free-flight of *X-15* is now set for early July. Captive test flights will wind up next month.

• • •

Polaris program is now driving toward two goals: 1.) production of the missile to provide emergency operational capability by 1960 when first subs are ready; 2.) development of the missile for 90% reliability over long pull. Lockheed will provide technical support for assembly at Navy's Charleston, S.C., facility. Next test series for *Polaris* expected this week will be to fire it from "shaker" simulating submarine.

• • •

France now is developing a tactical ballistic missile and a 2000-mile range IRBM. Mach 2 Mirage IV will be last piloted French bomber. Pre-production model expected to use Pratt & Whitney J-75 turbojets is scheduled to fly in 1961.

PROPULSION

Ammonium perchlorate aluminized solid propellant reported to be one of the most advanced in the industry has been successfully test-fired by Astrodyne from XM-34 rocket 16 feet long and 27 inches in diameter. I_{sp} is classified, but in-house developed unit produced 45,000 pounds of thrust and contained 40 times more propellant than any previous cast motor fired by the company.

ELECTRONICS

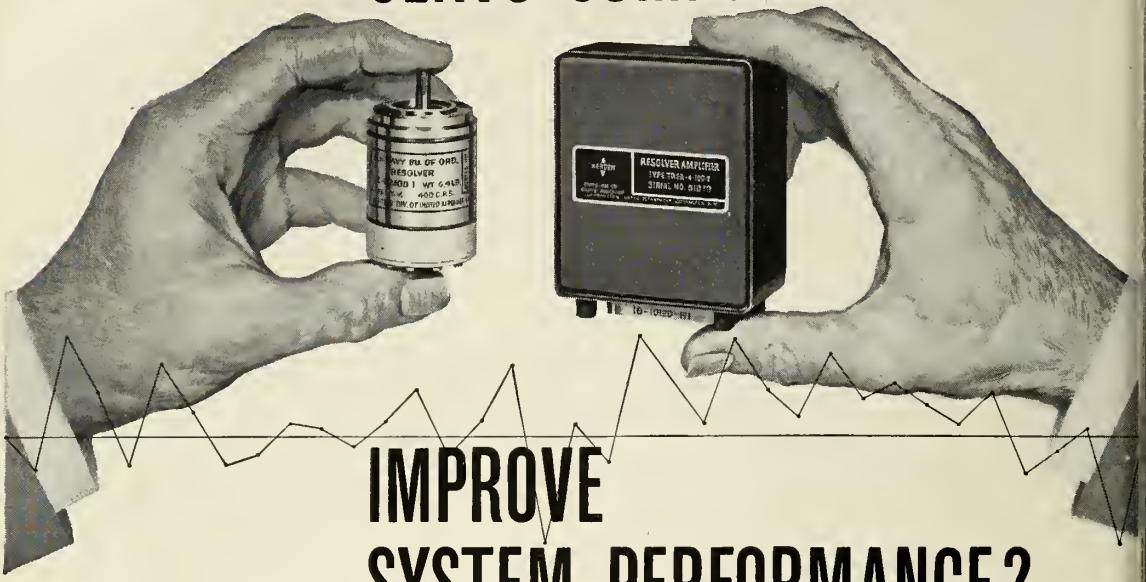
Look for an AF announcement soon that one of the largest (about $40 million) prime R&D contracts will go to Airborne Instruments Laboratory, a division of Cuttler-Hammer. Contract will be to develop airborne recon for B-52 and future aircraft with integration into a multi-weapon system. Subs are: Aerojet-General for IR; Filtron Co. for RF; Haller, Raymond and Brown Inc. for human engineering; Raytheon for semi-automatic receiver equipment; Sperry Gyroscope for tactical support and training; Sylvania for data processing; and Temco for weapons systems integration and flight test. Winning proposal, one of four presented on team basis, covered 1400 pages and cost $500,000 to prepare.

• • •

Pointing the way for practical ion propulsion of space vehicles is Republic Aviation's operating (for more than six months) magnetic pinch plasma engine producing a significant amount of measurable thrust which observers say reaches several thousand pounds for a micro-second. Prototype engine proves out Republic's "curved nozzle" theory.

• • •

Brand new field of semiconductor materials may be opened by high-temperature, high-pressure effects research at Army Signal Corp's R&D laboratory. Although process resembles making synthetic diamonds, emphasis is on changing electrical properties of materials rather than producing new ones. So far researchers have succeeded, in producing momentary super-pressure of several million psi, believed to be the highest pressure yet achieved.



SPACE MEDICINE

In nuclear-propelled space flight, Douglas Aircraft bio-astronautic scientists propose shielding occupants from radiation with three to six feet of liquid hydrogen around control compartment. The H_2 is part of the payload, being ultimately used as a reactor after-coolant following propulsion termination.

• • •

No space suits? Dr. Hubertus Strughold believes if space ships land in the "lowlands" of Mars—3,000 to 5,000 feet below the general surface of the planet—man could survive for short periods using only a pressure-breathing oxygen mask.

CAN "MATCHED" SERVO COMPONENTS

IMPROVE SYSTEM PERFORMANCE?

They certainly can! And if performance in your servo system is important, you owe it to yourself to check out the advantages "matched" servo components by Ketay can give you.

For example, Ketay's 105D2V Resolver (designated by the Bureau of Ordnance as Mark 4 Mod 1) trimmed to the TREA 4-100-2 Amplifier gives you a bonus of high performance and interchangeability:

1. The system will be trimmed to $\pm.02\%$ transformation ratio, with a phase shift tolerance of $\pm 1'$.
2. The amplifier will hold linearity to $\pm.02\%$ from $-55°$ to $+100°C$.
3. The receiver will achieve .05% conformity to the sine wave, and $\pm 3'$ interaxis error.

Similar benefits in matched performance can be obtained with system combinations using Ketay synchro transmitters, transformers, receivers, differentials, transistorized servo amplifiers, and servo motors.

But performance is not all you gain. When all or most of your components are from Ketay, broadest technical assistance is assured, and service and spares problems are simplified.

Ketay engineers are working on many advanced environmental and accuracy problems in developing prototype systems. Why not call or write for help in solving your servo component problems?

Ketay matched components:
SYNCHROS
RESOLVERS
POTENTIOMETERS
SERVO MOTORS
TACHOMETERS
SERVO AMPLIFIERS
GYROSCOPES

MAGAZINE OF WORLD ASTRONAUTICS

Air Force wants $343 million in FY '60 alone to harden Atlas and Titan bases . . . advent of Minuteman will swell outlay which could add up to . . .

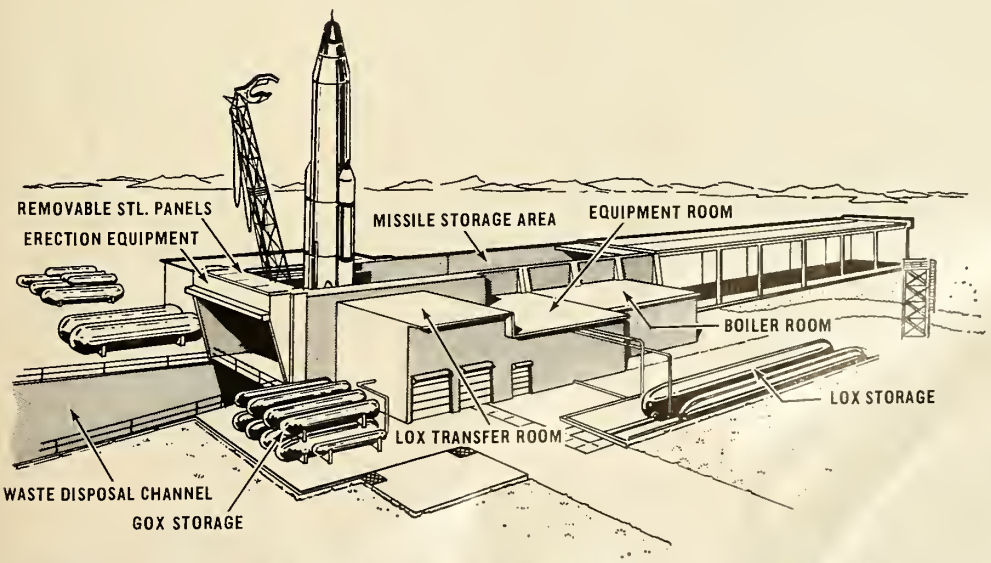
Billions for ICBM Launching Facilities

by William E. Howard

WASHINGTON—Challenging American industry today is a completely new dimension in defense installations—the ICBM launching base.

Only a few months old, the program to arm the United States with *Atlas* and *Titan* missile complexes from which to fire a knock-out retaliatory blow at Russia already is assuming vast proportions. The scope may be far greater when the solid-fueled *Minuteman*—with its projected 2600 launch silos—comes along in two or three years.

By the end of the current fiscal year on June 30, the Air Force says it will have committed $900 million for the construction of test, training and operational phases of the ballistic missile program. For the 1960 fiscal year, the Air Force is asking $343 million to go almost exclusively into the building of "hardened" *Atlas* and *Titan* launching sites.



First of a Series on MISSILE SUPPORT

Future spending on facilities—which require 80% of the total investment of a missile system—is hard to project. Today's plans may be changed tomorrow by new strategic, technological or political developments. But Pentagon planners have made it plain that the ICBM is to be the backbone of the defense system and they could spend billions on facilities alone in the next few years.

As of the present, there is no apparent "master plan" for ICBM installations. As one military engineer puts it: "The program is going ahead all at once, and it's a real can of worms."

• **Comparative costs**—The overriding consideration is money, of course. With underground *Titan* bases costing about $40 million apiece, and *Atlas* about the same, defense officials are looking to *Minuteman* as a cheaper answer. Once in production the Boeing *Minuteman* is expected to cost much less than the liquid-propelled *Atlas* and *Titan*.

And, although it will have only a one-megaton warhead, *Minuteman* will

ANNEX "A" at Warren AFB, Wyo., will include six missile launch and service buildings like this one. This and three additional, similar sites in the Cheyenne area will cost a total of over $27 million.

not require a large launching complex and manpower. It is designed to be left alone in a reinforced concrete silo far from population centers and available for instant use. One of its problems, however, is development of a reliable ground environment system—which may turn out to be expensive.

There has been considerable talk among missile experts of wide dispersion of any future *Atlas* and *Titan* launching sites, which also would run up ground support costs. Another complicating factor is that Convair's *Atlas* will be operational this summer, according to former BMD commander Lt. Gen. Bernard A. Schriever. But many Air Force officials feel the Martin *Titan* will be a better missile when it is ready later next year.

Is there a possibility of adapting *Atlas* to *Titan* bases? The Air Force says it's possible, perhaps, but impractical now—though future missile modification might make it feasible.

• **Present and future**—Construction of ICBM complexes is under way now at 11 Air Force bases in the U.S. A total of 20 ICBM squadrons are programmed—11 *Titan* and 9 *Atlas*. These squadrons will have a combined capability of firing approximately 180 ICBM's in a one-shot salvo. Present construction plans do not call for reloading the launchers, which will be used only in event of nuclear war.

Conceivably, military strategists will see the need for many more to hit targets out of reach of the 1500-mile *Thor*, and *Jupiter* IRBM line in NATO countries and *Polaris*. Russia is known to be readying huge underground civil defense shelters and presumably is also digging in much of its industrial and military establishment. To knock out these targets would require bigger warheads, such as the 7-megaton wallop packed by *Titan* and 4-megaton by *Atlas*, than are carried by IRBM's.

Whatever number will be needed eventually, top officials of many of the nation's biggest companies are betting it will be large. And they are already moving or preparing to move in a big way into supplying the huge amounts of steel and concrete and the multitude of fabricated parts, electronic equipment, heavy machinery and other items which go into ICBM ground support.

Ahead of industry are some monumental engineering and development problems. Much of the present construction calls for completely underground installation—and a new breed of military personnel, "molemen," to operate it.

• **Design complications**—Each ICBM launching site must be tailored to fit the weapon it is designed for, and human occupancy as well. And complicating it all is a design requirement of the missile silo, control section, personnel quarters, power facilities, communications and computer-guidance equipment to withstand the overpressures, ground shock and radiation from a nuclear attack. For the bases are being built for up to 100 psi hardness under the concept that this country will be hit first before it strikes back.

A high Pentagon official told M/R that a key problem is "shock spectra criteria." Not enough is known about blast effects on a 90-foot missile like the *Titan*, which is put together with extremely close tolerances, or to extremely delicate electronic ground support components.

Suspension of nuclear tests, moreover, is preventing design engineers from obtaining the data. As a result, many experts feel that presently planned ICBM bases may be overdesigned. Nuclear tests last year, one official said, enabled them to cut back somewhat on the specifications for *Titan* bases. But they believe more could be done at a considerable saving in money.

Being built into bases now for personnel safety are free-floating floors and rubber mountings to absorb ground shock and complicated air filtration systems to protect "molemen" from radiation.

The Air Force Ballistic Missile Division, which is running the entire base construction program from its Los Angeles headquarters, has initiated environmental studies to obtain much-needed experience with people subjected to long periods of underground living.

The Air Force expects to utilize many off-the-shelf items developed by the Navy for submarines and ships to outfit the underground missile nests.

• **Lowry bases**—The first fully-operational *Titan* base is being constructed at Lowry AFB near Denver. Bids on a second Lowry facility will be opened May 27. Each will house one squadron of *Titans*—with nine launching silos.

Roughly comparable to putting a 10-story building underground, the first Lowry facility—composed of three complexes, each with three missile silos—will cost about $40.6 million without sensitive instrumentation equipment. The silos are dome-shaped, 163 feet deep and 40 feet in diameter.

Each complex will include a 73 x 27 foot storage silo for spare missiles; a spherically-shaped domed control center with a 39-foot ceiling and a 51-foot radius; spherical powerhouse measuring 46-feet high and having a 62-foot radius; propellant storage silo 47 x 37 feet; equipment storage silo 62 x 40 feet and two guidance antenna silos each 27 feet in diameter and 68 feet deep.

Connecting steel tunnels are provided. These include a nine-foot six-inch diameter personnel tunnel, a similar sized utility tunnel, a 12-foot diameter fuel and lox tunnel connected with six-foot six-inch diameter offset tunnels to each missile silo and nine-foot six-inch diameter exhaust tunnel structures as well as a five-foot diameter ventilation tunnel to blast locks.

The bird will be assembled on the silo elevator, motors first. At instrumentation sections there will be openings in the silos for test and checkout. To fire, *Titan* will be raised to the surface, and doors will close automatically over the silo opening. Simultaneously, the six antennas will also be elevated to the surface.

Design and fabrication of the silo elevator and missile handling equipment is by American Machine and Foundry under BMD contracts totalling $43 million. Western Electric, which has the guidance contract for *Titan*, and Aerojet-General, the powerplant, are overseeing the design of their own antenna and fuel installations.

The architectural design and engineering of *Titan* bases is divided between two firms—Daniel, Mann, Johnson & Mendenhall and Ralph M. Parsons Co. These firms are also doing the A&E for *Minuteman* bases.

• **Vandenberg specs**—A conception of the overall materiel requirements is contained in contract specifications issued by the Army Corps of Engineers for building three training silos at Vandenberg AFB. They call for excavation and subgrade preparation of 80,000 cubic yards of earth; 475 tons of steel ring beams and rods for bracing and shoring shaft excavations; 1691 feet of 10-foot steel tubing for tunnels; nearly 4000 feet of steel waterline for the fire water-control system; another 2000 feet of galvanized steel pipe for the domestic water supply; 2084 feet of sewer pipe; 3534 feet of perimeter fencing, and a number of valves, complete electrical control and distribution systems, blast locks and manholes.

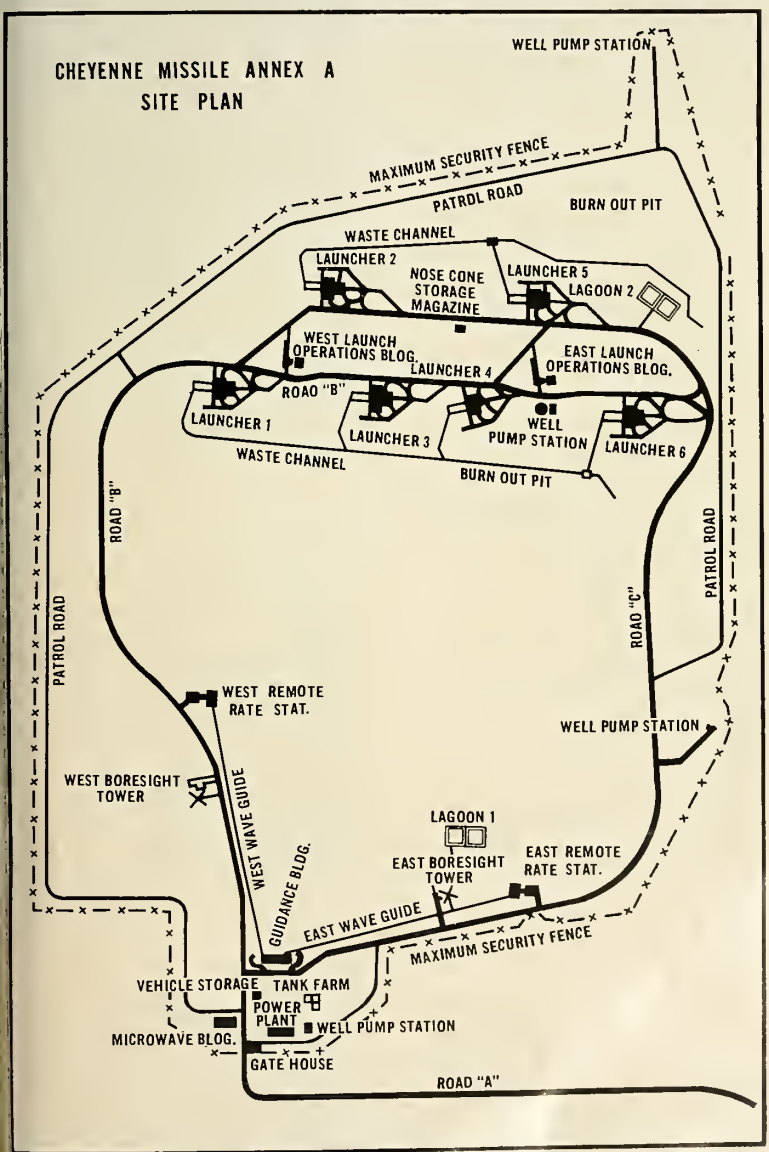
Requirements for paving include 8530 square yards of various types of concrete and 797 tons of bituminous and asphalt topping and cement.

Cost of this work alone will run to nearly $7 million and it is expected to take 540 days to complete. Ground was broken in March.

Other *Titan* installations are being built at Ellsworth, S.D., and Mountain Home, Idaho.

The first operational *Atlas* will be deployed at Vandenberg AFB.

Construction is starting this spring on *Atlas* bases at Offutt AFB, Neb., which is SAC headquarters, and Fairchild AFB, Wash. Digging will begin this summer at Forbes AFB, Kan.



Other *Atlas* installations are planned at Schilling AFB, Kan., and Lincoln, Neb.

The two at Fairchild and Forbes will be "hard" bases.

• **A "soft" base**—Construction is nearly complete at the first "soft" *Atlas* site at Warren AFB, Wyo. Here there are four launching "annexes" located at an 18-mile radius from the four corners of Cheyenne. Annex "A"—to be ready this fall—has six launchers; the other three annexes will each have three launchers. Total cost: over $27 million.

Although above ground, the Warren facilities are being constructed of reinforced concrete and steel, enabling them to withstand considerable overpressure. The missile is housed and serviced in a horizontal "coffin" type structure, which has a mobile roof to allow the missile to be erected on a launch pad for firing.

Annex "A" is comprised of six missile launch and service buildings, each 103 x 133 feet, two blockhouse operations buildings measuring each 73 x 78 feet and a 75 x 212 foot guidance building. Pre-stressed concrete panels up to 36½ feet long go into the roof and part of the floor of the guidance building. Included in this facility are two boresight towers and two remote rate stations situated about 1300 feet east and north of the building. They are connected to the facility by waveguide enclosures.

FIRST "SOFT" *Atlas* site will actually be built with heavy amounts of reinforced concrete and steel. Some pre-stressed concrete panels will be 36½ feet long.

Design of the three other annexes is almost the same, with each site having half the amount of facilities of Annex "A".

The Corps of Engineers gives this rundown on materiel employed to build Annex "A": structural steel—1140 tons; reinforcing steel—1950 tons; mechanical steel items—8040 tons; electrical—1430 tons; concrete blocks and pre-stressed members—4350 tons; cement—6300 tons; concrete aggregate—37,460 tons; road aggregate—66,120 tons; asphalt—800 tons; miscellaneous wire, lumber, nails etc.—1260 tons. Total—128,850 tons.

Tanks to store oxygen, nitrogen and helium are located outside the building and above ground. In all there are 192 tanks in sizes up to 28,000 gallons. Fueling system has pressure capacity up to 15,000 psi and is of heavy stainless steel.

A&E for *Atlas* sites is under contract to Bechtel Corp., Stearns and Rogers, Holmes and Narver and Black and Beatch. Bechtel has the design for installations at Forbes, Fairchild and Lincoln. Stearns and Rogers has Schilling and Lincoln; Holmes and Narver —Warren and Black and Beatch—Offutt.

• **Jurisdiction**—All of the responsibility for design and construction of ICBM base facilities comes under the installations section of the BMD. This section establishes the technical criteria for the A&E firms and monitors their work.

The Corps of Engineers takes over as the constructing agency. At Warren AFB, for example, the work comes under the jurisdiction of the Omaha District Engineer and the Missouri River Division. Competitive bid prime construction contracts are let by the district engineer for major facilities, on authority issued by the Los Angeles District Corps of Engineers, which is working directly with BMD. Supervision of construction and coordination of the paperwork falls on the Cheyenne area engineer. BMD also maintains an on-site field office. On completion, the base is handed over to SAC.

Heading up the operational end is the 1st Missile Division. Last January the 706th Strategic Missile Wing (*Atlas*) and the 703rd Strategic Missile Wing were integrated with the 15th Air Force. The 706th SMW will have two squadrons at Warren, and the 703rd SMW is at Lowry.

Training of missilemen is underway at Vandenberg by the 704th SMW, and the 704th Instrumentation Squadron, the 394th Missile Training Squadron and the 576th Strategic Missile Squadron.

Also under construction is a missile targeting center at SAC's Offutt AFB.

This will be operated by SAC's directorate of intelligence. The Air Force says the center will supply all SAC missile bases with trajectory data. Systems to be used include paper tapes with pre-cut targets, enabling base crews to feed guidance information into the missile system "in a matter of minutes."

• **No lagging**—Historically, facilities have frequently lagged behind the development of weapon systems. The ICBM program has been a marked departure. Gen. Schriever, commenting recently on the lead-time requirement of 18 months to construct an ICBM base, said "we haven't the time to perfect the missile and then build. We have had to do it simultaneously."

So far the base-building program appears to meeting the missile development deadline. But the picture could change, quickly, with a sudden menacing move by Russia.

If top planners abruptly decide many more ICBM's are needed, construction will have to be shoved onto a "crash" basis. A high official in the Corps of Engineers told M/R that it might be possible to build bases within six months "going all-out." The present program is taking up only 3% of the construction industry's capability; thus there is a large untapped potential.

Congress is still up in the air as to how much more funds it wants to pump into the ICBM program, over and above the amount requested in President Eisenhower's budget. It is almost a sure bet, however, that lawmakers will increase the figure substantially.

• **More questions**—Aside from money uncertainties, there are other headaches confronting missile base builders. What is the ceiling on destructive capacity? Will the present and programmed nuclear capability of the U.S. be so great when exploded with Russia's in a war that the globe would become uninhabitable afterward? At what point does building more hydrogen weapons become academic?

Air Force officials, too, are conceding in private that public relations problems are looming in connection with ICBM locations. Every new site becomes another Soviet target—and with it the surrounding civilians.

This has inspired some studies on the feasibility of dispersing the launchers over much wider areas. And in the case of *Minuteman* thought is being given to making their launching equipment mobile. They could, for example, be moved from place to place on barges towed along rivers or be fired from railroad flat cars.

Next week: Requirements for Establishing an Equatorial Launch Site

RCA Demonstrates Solar Cell Using Gallium Arsenide

Company also shows new 'tunnel' diode and rectifier, calls development of vital importance

PRINCETON, N.J.—A new match-size solar cell which uses a high-temperature compound called gallium arsenide to transform light into heat has been developed by RCA scientists, who say it holds great promise for use in space vehicles.

A solar battery built around the novel cell, and a radio system using a new high-temperature diode of the same material, were demonstrated for the first time last week by the RCA Semiconductor and Materials Division at the National Aeronautical Electronics Conference in Dayton, Ohio.

The battery was shown powering a miniature radio transmitter of a model satellite which uses a gallium arsenide "tunnel" diode.

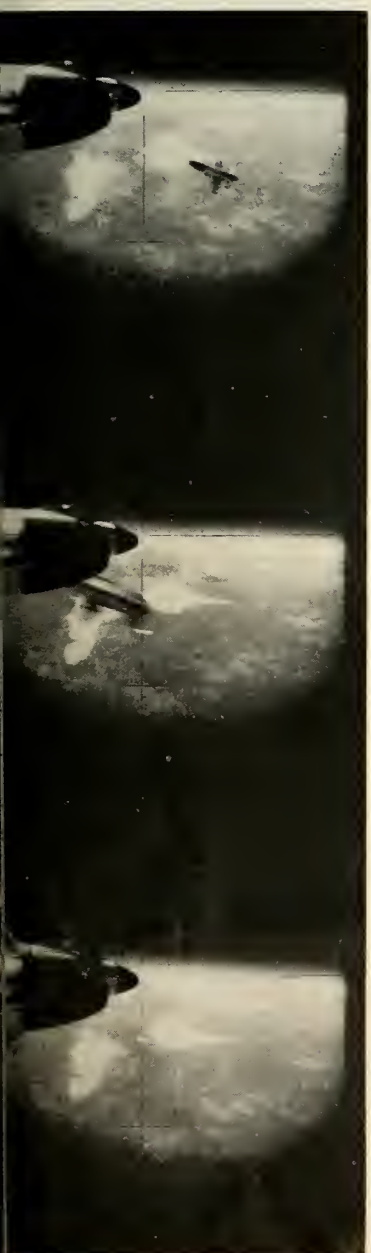
The RCA exhibit at the conference was assembled to show military personnel and engineers the progress made by the firm's investigation of new compound semiconductor materials which can operate at high temperatures up to 750°F, without appreciable loss in operating efficiency.

Beside the solar battery and radio system, the exhibit included new gallium arsenide rectifier diodes—the first high-temperature devices, according to RCA scientists, which compete electrically with diodes made from conventional semiconductors such as germanium or silicon.

The research leading to the new units was performed at RCA's David Sarnoff Research Center at Princeton. The gallium arsenide devices shipped to the Dayton conference were developed by Paul Rappaport, Joseph Loferski and Dietrich Jenny, members of the RCA Laboratories technical staff.

The solar battery was developed under sponsorship of the U.S. Army Signal Corps. The high-temperature diodes were developed at the laboratories under sponsorship of U.S. Air Force Electronic Components Laboratory, Wright Air Development Center, Dayton. The rectifier diodes are the result of a contract with the Air Force's Manufacturing Methods Division of the Air Materiel Command.

• **Potential**—According to RCA scientists the match-size solar cell, the basic element of the solar battery, promises to be extremely useful in powering electronic equipment in satellites, missiles, high-speed jet aircraft and other space vehicles. It is expected that gallium arsenide solar cells will give higher efficiency than the silicon solar cells now aloft in a number of America's satellites.



When light is focused on the surfaces of the solar cells, electricity is generated and fed to the transmitter. The transmitter consists of a coil, a capacitor and a new electron device, the "tunnel" diode, which is also made of gallium arsenide. Signals from the transmitter within the model satellite are picked up on a nearby radio receiver in the display.

The development of gallium arsenide devices is of vital importance to the electronics industry, according to Dr. Alan M. Glover, Vice President and General Manager, RCA Semiconductor and Materials Division.

"The new solar cell promises higher efficiency over a wider temperature range than present cells using other materials now available," he said. "The voltage output of the gallium arsenide cell matches the voltage requirements of the newly-developed 'tunnel' diode which operates the transmitter in the model satellite.

"The 'tunnel' diode is itself the industry's first gallium arsenide device to generate high-frequency radio signals. It promises great simplicity in circuit design, high reliability, high frequency operation and operation over a very wide temperature range. Furthermore, the diode's bi-stable characteristic makes it particularly suitable for use in electronic computers."

- *Progress on 24-channel time multiplex system*
- *No decision yet on a British spaceflight programme*
- *Blue Steel readied for test at Woomera*

DIRECT HIT is scored by a Bristol/-Ferranti *Bloodhound* launched in trial at Woomera Range. The surface-to-air bird is already in RAF service.

by G. V. E. Thompson

LONDON—The British Institute of Radio Engineers recently held a one-day symposium on radio telemetry. Most of the papers dealt with the 24-channel time multiplex system, in which up to 24 signals are selected in turn and transmitted over the radio link. This system has been chosen for missile work, in preference to frequency multiplexing or pulse systems, by the Royal Aircraft Establishment (responsible for guided weapons R&D of the U.K. Ministry of Supply).

The missile-borne telemetry equipment must withstand temperature ranges of −40°C to +85°C, pressures of the order of 35 mm mercury, vibration levels of 50g in the frequency spectrum 10 cps to 7 kc/sec and 50g shock loads. It must be immune to fungus and salt spray. To meet these requirements, various modifications had to be made to the prototype after environmental testing. A transmitter is now in production by E.M.I. Electronics Ltd.

A series of 24-channel receiving and recording systems have been commissioned from electronic firms by the RAE. The most recent—manufactured by McMichael Radio—is compact, incorporates improvements to facilitate operational use, and is completely mobile.

The Guided Weapons Engineering Department of the Bristol Aircraft Co. have developed a frequency multiplex f.m./a.m. system which transmits six channels of bandwidths such that frequencies in the range 10 cps to 10kc/-sec can be telemetered simultaneously. With commutated reference levels, the frequency coverage can be extended to include the band 0-10 cps. There have been only four failures in several years' firing of pilotless test vehicles, involving 600 units—a performance attributed to the fact that only a few components in the main transmitter are common to all channels.

In addition to recorders and test sets for the 24-channel time multiplex system, the firm J. Langham Thompson has produced a 20-channel, 600 mc/sec-pulse telemetry system. Using pulse position modulation, it is designed to handle information containing transients of the order of 1 msec from guidance equipment.

• **Still no programme**—No decision has yet been reached by the government on whether to establish a British spaceflight programme. Such a programme would be welcomed by the aircraft industry, which faces lean times as a result of changes in defense policy and the pattern of civil aviation.

It is estimated that two years from now the number of people engaged in the U.K. aviation and missiles industries will be 100,000 less (a reduction of 40%). A spaceflight programme would help to prevent this. However, economists and politicians are doubtful whether national resources are sufficient to support such a programme in addition to the other large technical projects in hand.

At a conference organized by the Institution of Production Engineers, Peter G. Masefield, Managing Director of Bristol Aircraft and President-Elect of the Royal Aeronautical Society, said: "Regrettably, perhaps, the financial ticket is the passport to success or failure. The millions which are being poured into aeronautics and astronautics by the United States and the U.S.S.R. cannot be matched except by adequate funds to compete in *selected* fields. How limited these fields should be is the biggest policy issue of all."

• *Blue Steel* **air-to-ground missile**—First full-scale firing of the Avro *Blue Steel* aerial torpedo is expected to take place soon on the Woomera rocket range in Australia. Details of the design of the missile are still secret but it is known that it is intended to be launched from bombers flying at around 60,000 ft at a distance of over 100 miles from the target.

Successful stage separation of *Titan* was reported by the AF in May 4 firing. Second stage was freed by ignition of two small solid-fueled rockets. Test was prelude to second stage ignition test of the 90-foot vehicle.

Slow contract negotiations, say West Coast missile makers, are making conduct of business with DOD tougher all the time. Example: in the past negotiations took 60 days for continuing development contracts; last year they ran to 11 weeks and this year they are starting later, probably in July, and are expected to last 15 weeks. This runs up overhead costs.

In Paris, France's rocket-making M.A.T.R.A. Co. is reported exporting 10% to 12% of its 511 air-to-air missiles to countries like India and Israel which use French-made fighter planes.

Missile-borne MASER amplifier is now under development at the Army Signal Corps R&D laboratory at Fort Monmouth. Feasibility has been proved, but future development may be limited by present state-of-the-art. Need is to eliminate pumps, among other problems. One MASER, greatly reduced in size, has operated continuously for days.

National Bureau of Standards analysis shows last summer's nighttime high-altitude nuclear bomb explosions ionized the upper atmosphere to near daytime intensity. The resulting electric current flows temporarily altered the earth's magnetic field. Significance of the observations is that man may some day control the ionsphere and radio communications—a vital factor in wartime.

AIA in its new edition of "Aviation Facts and Figures" reports the earnings of the 12 major aircraft and missile manufacturers decreased during 1958, despite record sales. Dollar volume for the 12 totalled $7.2 billion—up 5% from 1957. Aggregate earnings after a tax bite of $153 million were $142 million, or 2%. The 1957 earnings were 2.4%. AIA points out that the average earning rate for all other industries is about 6%.

Mergers & Expansions: Radiation Inc. of Melbourne, Fla., has merged with Levinthal Electronic Products Inc. of Palo Alto, Calif. Another cross-country combination is the Laboratory for Electronics at Boston and Servomechanisms Inc. of Los Angeles. Fansteel Metallurgical Corp. is building a 20,000-square foot plant at North Chicago with a daily capacity of 30,000 silicon rectifiers. A new 50,000-square foot facility is going up at Moorestown, N.J., for Philadelphia Insulated Wire Co. In the Boston area, Clevite Corp. of Cleveland is erecting a $3 million transistor and diode manufacturing plant. Space Electronics Corp. of Glendale has formed an exploratory development department—to develop advanced concepts for technical proposals and R&D in areas of applied physics.

Products: Latrobe Steel Co. has a new vacuum arc melting furnace to produce highly refined tool steels and superalloys. Improved version of its transonic jet-drone *Q-2C Firebee*, Ryan Aeronautical reports, recently hit a new altitude of 59,000 feet. Maximum speed was Mach .95.

Contract for *Pogo-Hi* II E3C Target Missile system has been received by Aeronca Mfg. Corp. for delivery by June 27 to the AOMC White Sands Missile Range. *Pogo-Hi* has Thiokol solid motor and is used to test *Nike-Hercules, Talos, Sidewinder* and *Falcon* at altitudes up to 80,000 feet.

Urgent need for miniaturized electronic equipment to obtain physiological data in early stages of *Mercury* man-in-space program will be underlined at a Franklin Institute, Philadelphia, symposium May 18. Discussions will center around transducer and television applications of bioastronautics.

Boeing Airplane Co., in an effort to expand dealings with small business, now has a policy instructing its buyers to indicate with each order the reason for placing it. If it is not a small firm, buyers must say why.

Anaconda Wire & Cable Co. has purchased Sequoia Wire and Cable from Mandrel Industries Inc. New subsidiary will make small wires for use in missiles, aircraft and electronic controls.

Britain's Royal Air Force is ordering an improved version of the ground-to-air *Bloodhound* produced by Bristol/-Ferranti. New system is reported to have "substantially" increased operating range and altitude over earlier models.

Financial notes: Texas Instruments President Patrick E. Haggerty expects company sales to hit between $185 million and $200 million in 1959 with earnings of about $13 million—more than double the 1958 figure. On the downside, Chance Vought Aircraft reports first quarter sales of $66 million and net of $1.5 million compared to the same quarter in 1958 when sales were $78 million and the net $2.3 million. C-V's backlog as of March 31 was $330 million. On the same date a year ago unfilled orders totaled $595 million. First quarter earnings of the Martin Co. of $3 million are up from the $1.6 million net of a year ago. Sales during the period were $122 million—an increase of 27% over the $96 million in sales of the like 1958 period.

A $6 million LOX, liquid nitrogen and liquid argon plant is being built by Air Products Inc. at Glassmere, Pa. First production is scheduled this fall.

First *Vega* contract for $33.5 million has been awarded by NASA to Convair. Test flights of the three-stage vehicle (*Atlas, Vanguard* booster and new JPL rocket) are scheduled late next year. NASA, which ultimately may spend $76 million on *Vega*, plans to use it to put a manned satellite into orbit and to make instrumented lunar and planetary probes.

Seven firms are in the competition for subcontracting elements of the Boeing *Minuteman* airborne telemetry test equipment. They include Consolidated Electrodynamics, Texas Instruments and Radiation Inc. Selection of the subcontractor will be made late in the summer.

SAC troops successfully fired a second *Snark* May 5 from Cape Canaveral 5000 miles down the Atlantic test range. Flight time was 8 hours and 45 minutes.

Pursuing its diversification program, Lockheed Aircraft discloses it is exploring a possible merger with Lear Inc.

Air-to-Air and Ground-to-Air Missiles

The M.A.T.R.A. Company, a French firm which specializes in the manufacture of rocket launchers and missiles, employs about 1200 in five plants. Two are in Paris (one is for airframes and another plant is for prototypes). Others are Boulogne-sur-Seine, a suburb of Paris (laboratories, tests, mechanics), Salbris (production line of rocket launchers) and Courbevoie, near Paris (laboratories, wind tunnel).

The main production of M.A.T.R.A. now consists of rocket launchers, but the type *422* ground-to-air and the *511* air-to-air missile (shown in these photographs) seem assured of a good future. They are being ordered in quantities to equip the next generation of French fighters. Ten to 12 percent of the M.A.T.R.A. production is now exported, particularly in such countries as India or Israel which use French-made fighters.

THE Vautour weapon system includes this massive array of rocketry.

ARCON and *ARCAS* Renew Interest In End-Burning Rockets

Descendants of earlier JATO's offer high-burning rates and flexibility and may provide cheap rockets for weathermen

by Michael Lorenzo*

WASHINGTON—The state of the art of solid propellant rocketry has been enhanced by recently-released novel design information on end-burning *ARCON* and *ARCAS* type rocket motors—a concept which could be likened to a burning cigarette.

These are technological derivatives of earlier vintage end-burning asphalt composite JATO's. They utilize conventional solid propellants in much the same way as do the familiar star and other hollow grain configurations.

Since all of the volume in the rocket case is used to house propellant and inhibitor, the resulting propellant mass fraction can be made high—taking advantage of the natural log function of the structural efficiency parameter of the ballistic missile range equation. Specific impulse and characteristic velocity figures obtained in development thus far are comparable to other members of the SPR family.

The comparatively smaller diameter of an equivalent mass end-burner design helps to facilitate aircraft installation in the case of JATO applications and lessens bulk in missiles. This smaller cross-sectional SPR design should create less drag in most applications—an airborne installation being more sensitive than a ballistic vehicle.

• **High burning rates**—An approximate value of 52.5 inches can be derived for the *ARCAS* rocket-motor length by differences in the accompanying table of design characteristics. The length of the grain can be estimated at 47 inches. Similarly, the *ARCON* rocket-motor and grain lengths are estimated to be 102.6 and 96 inches, respectively.

These end-burning grain lengths when considered with their burning times give corresponding values of 1.9 and 2.9 inches per second as burning rates. These values are considerably higher than those encountered in hollow grain solid propellants and, if correctly deduced, would obviously represent the basis for the current renewed interest in end-burning rockets.

• **Flexibility**—Paradoxically, published textbooks on rocket propulsion describe solid-charge end-burners as *restricted* burning types and hollow charges as *unrestricted* burning types. After taking note of the aforementioned burning rates of the *ARCAS* and *ARCON* motors, the nomenclature *restricted* probably should be changed to *adjustable* or *flexible*.

The end-burning design is innately flexible in that adjustments to achieve specific burning times, corresponding altitudes and/or ranges can be accomplished by simply cutting the length of a standard motor to a required size.

• **Development**—The *ARCAS* meteorological rocket is being developed for the Geophysics Branch of the Office of Naval Research by the Atlantic Research Corporation, Alexandria, Va. The Aerology Division of the Navy Bureau of Aeronautics and the Air Force Cambridge Research Center also are supporting this project which is headed up by Lt. Cmdr. "Sam" Houston of the Office of Naval Research.

On Jan. 27, the Army's Signal Missile Support Agency successfully fired this rocket to an altitude of 179,200 feet at White Sands, N.M. Col. John McGovern, commanding officer of the Agency, announced that this low-cost meteorological rocket system can be completely assembled and launched by a two-man crew within two hours. The closed-breech launcher consists of five major parts weighing a total of 39 pounds. It stands 11 feet 8 inches high and imparts a 100 fps exit velocity.

ARCAS (All-purpose Rocket for Collecting Atmospheric Soundings) eventually will be made of finely-spun glass fibers so that it may be fired by meteorological personnel over populated areas and exploded to fragment after it has gathered needed data.

ARCAS now joins a family of atmospheric data-collecting rockets including *Loki, Nike-Cajun,* and *Aerobee-Hawk*. It will be developed to carry payload weights of approximately 12 pounds (rocket total weight is 7 pounds) as high as 206,000 feet. The *Iris,* designed to carry 100 pounds 20 miles high, is in advanced development at Atlantic Research and completion is anticipated early next year.

Rocket vehicles used by meteorologists in the past have been expensive, heavy, bulky and complicated affairs converted from military missiles with high acceleration rates which damage the data-seeking instrumentation. Cost

rbade routine us of them for gather- weather data.

ARCAS, developed from the draw- board as a pure meteorological cket, seems to be an answer. It can fired almost as easily as a mortar ell, provided close supervision is car- d out by personnel experienced in cket trajectory calculations.

These *ARCASes* fired by SMSA ay be forerunners of inexpensive stic rockets that meteorologists will e daily to provide much needed curate weather forecasts.

The prima facie pros and cons of id-propellant end-burning grains ap- ar as follows:

• **Advantages**—1. The entire rocket se volume, with the exception of a ripheral volume occupied by insula- n and inhibitor, is utilized for pro- llant loading.

2. Problems of burning in a cavity, ., resonance and erosive burning, are eliminated.

3. Desirable aerodynamic shapes, i.e., high length-to-diameter ratios, may be achieved in long-duration applications. The length of an existing standard rocket can be readily adjusted to attain desired total burning time and resulting range and/or altitude.

4. In sounding-rocket applications, increased burning times permit conservation of fuel during low-altitude operation for more effective use in the thinner air above.

5. The simple geometrical shape of the grain reduces processing problems, relieves the demand for excellence of physical proprties which may conflict with the attainment of high performance, and gives rugged, shock-resistant grains.

• **Disadvantages**—1. Insulation is usually required to protect the motor case from the combustion gases as the burning surface recedes; however, insulation can be tapered toward the head end, and the relative volume occupied by insulation decreases with increasing motor diameter.

2. The center of gravity of the rocket shifts during burning; although the net shift is the same for end-burning and internal-burning grains, the mean location of the center of gravity of an end burner is forward of the mean center of gravity in a central-perforated system.

Some "imagineer" undoubtedly will see another seemingly innate advantage of end-burner designs by adopting an autophagia (from the Greek word "autophagos" meaning self-devouring) combustion principle. This certainly should enhance the state of the art of increasing the propellant mass fraction and resulting performance. After all, the chemist is well on the way to reaching the physical limit of releasing chemical molecular bond energy.

GHTNESS and ease of handling for *cas*, 72-pound research rocket is design uirement.

TAKE-OFF from Wallops Island, d-burning *Arcon* has high acceleration.

New Theory Advanced for Hydraulic Failures

WASHINGTON—The failure of missile hydraulic and liquid fuel systems may be caused by the same sort of stress which causes strokes in humans, according to a theory advanced at the American Physical Society meeting.

The theory was described in a paper presented by Harry Lobel, an electrical engineer who has done extensive private investigation into the application of electrical analogs to fluid flow and the human circulatory system.

Lobel has applied his studies to the design of hydraulic fittings patterned after arterial bifurcations which compensate for surges and stresses which may lead to failure.

Ideally, such junction fittings would be designed to change configuration automatically in response to varying stress conditions caused by turbulence, vibration, and cavitation. Lobel feels, however, that a non-variable fitting could be developed to compensate for a relatively wide range of variations.

Free-rotor Gyroscope Developed by Autonetics

LOS ANGELES—Inertial guidance platforms may be considerably simplified and made more stable by the use of a "free-rotor" gyroscope developed by North American's Autonetics Division.

Only two of these gyros are needed to stabilize an inertial reference platform whereas at least three conventional single-axis gyros are now used. In addition, a simple second-order type servo system will suffice, with inherently more stable characteristics and less complicated electronic circuitry.

The rotor is supported and turns in a spherical gas-lubricated bearing—with practically no friction and wear. The overall mechanical assembly is less complex and reportedly there is no need for gimbaling and liquid flotation of the rotor assembly.

The spherical bearing must be manufactured to extremely close tolerances. However, the minimum number of parts and the long life predicted for the gas bearing should lead to a considerable gain in reliability. A prototype bearing has been operating continuously at Autonetics for seven years.

Telemetering Conference

"Investigation of Space" will be the theme of this year's National Telemetering Conference at Denver, May 25-27. Papers and panels of telemetry experts from over the nation will discuss progress of telemetry and its important role in space exploration.

The conference, jointly sponsored by ARS, AIEE, IAS, and ISA, will be chaired by Max Lowy of Data Control Systems, Inc. Alan P. Gruer, of Sandia, is program chairman.

Some sessions scheduled and their respective chairmen, include:

Critique and Comparison of Various Telemetry Systems for Space Instrumentation, John Eckhart, Sandia Corp; Telemetry System Integrity, W. M. Koellish, Martin-Denver;

Miniaturization and Transistorization Progress, C. E. Ruckstuhl, Bendix;

Ground Stations - Techniques and New Components, K. A. Hall, STL;

Space Medicine Problems Probed by AMA

by Frank G. McGuire

LOS ANGELES—The 30th annual meeting of the Aerospace Medical Association here opened a Pandora's Box of radiation, weightlessness, psychological disturbances, physiological hazards and inter-agency bickering to be faced by the first astronauts.

Along with these, it brought out some interesting solutions to several problems, including hibernation to ease extremely long, boring space flights; severing of certain nerves in the inner ear to avoid motion sickness in space; and assuming a fetal position to present a smaller target for intense radiation. No simple solution for the inter-agency fights was forthcoming.

Some highlights of the conference:

• Dr. Hubertus Strughold, Air Force space medicine chief who is also an M/R contributing editor, said man may be able to operate in the Martian lowlands with no more elaborate equipment than an oxygen mask, and that man may be unable to survive the 100°C heat on Venus.

• The possibility that man may be able to venture into deep space for only three years out of every eleven was voiced by Dr. Hermann J. Schaefer of the Navy's School of Aviation Medicine at Pensacola.

• The technique of spinning a satellite to provide an artificial gravity for the occupants may give rise to a motion sickness so severe that the astronauts might be much happier in a weightless state, according to Dr. Ashton Graybiel, also of the Navy's School of Aviation Medicine.

• A lone man on a protracted mission into space might soon find himself completely detached from his own personality and convinced that he can't possibly be that silly fool sitting in a space ship and going nowhere. Lt. Col. Jerrold L. Wheaton, USAF neuropsychiatrist, added, however, that a properly selected individual might be trained enough to circumvent this situation.

• The problem of weightlessness compounds, according to Dr. Harald von Beckh of Holloman AFB, when the subject suddenly awakens and finds himself in this state, contrasted to the ease with which he adapts to it when fully expecting it.

• **Space-suit-less?**—Dr. Strughold told a press conference at the meeting that Mars has certain lowlands with an atmospheric pressure equivalent to 45,000 feet in the earth's atmosphere. This would allow, he said, the wearing of heavy clothing and an oxygen mask. The climate there is about like that of the Pamir Plateau in the USSR. Other areas of the Red Planet, with higher elevations, have pressures equivalent to about 55,000 feet, and will probably require a pressure suit.

On Venus, Strughold said, there is a great amount of CO_2 in the atmosphere, resulting in a high heat-absorption that makes a "greenhouse effect." The surface temperature of the planet may thus be as high as 100°C, preventing manned exploration.

• **Radiation**—The data obtained from *Pioneer III* was not borne out by *Pioneer IV*, said Dr. Hermann J. Schaefer, and it now appears that the radiation intensities near earth are as much as ten times that predicted by van Allen. The inner belt particles have much higher penetrating power, he said, and the shielding problem here may be hopeless.

There is a possibility, however, that the situation as shown by *Pioneer IV* is only a temporary one resulting from a solar flare that occurred a few days before the launching. In this case, it is likely that a manned space ship caught in a burst of radiation from a solar flare would be doomed. The radiation intensity could easily increase one-thousand-fold in fifteen minutes with no warning.

The use of polar exits from the earth's vicinity could solve the problem, he said, but there is reluctance to use this method because of the greatly complicated navigation problem. If the worst indications of *Pioneer IV* data are confirmed by future findings, it may be possible for man to leave the earth's vicinity beyond 1000 km for only the three inactive years of the eleven-year solar cycle.

• **Motion sickness**—The astronaut riding in a rotating satellite in orbit may be content to let weightlessness take its course rather than suffer the miseries of motion sickness under artificial gravity. This opinion from Dr. Ashton Graybiel came after experiments had shown that persons who do not keep their heads perfectly fixed while rotating become violently sick.

Head movement during rotation causes angular acceleration in the semicircular canal of the inner ear in a different plane than that being maintained by the rotating satellite. While it is possible to use drugs to offset this condition, it is more desirable to cut the nerves leading to the semicircular canal. Severence of these nerves is not difficult, he said, and it does not impair the hearing.

• **Extreme boredom**—Behavior and emotional problems in space ar not easy to predict accurately, becaus of the difficulty in reproducing cond tions there. Any subject undergoin psychological tests in an isolatio chamber, etc., is fully aware that a though he may be isolated, he is sti on the ground and safe.

However, extreme boredom tak over and an astronaut may find hin self daydreaming and dozing off. Whe awakening to find himself still in cramped and lonely space ship, he wi become irritable and restless. After while, his thoughts turn to fantasy ar he becomes detached from himself.

"After a length of time dependi on the type of person he is, he will n know who he is, but he'll be sure he not that silly fool sitting all alone in space ship going nowhere," report Col. Wheaton. But a carefully selecte and mature individual might g through a lengthy trip with no mo than mild irritation, he said.

• **Hibernation**—Defining hibern tion as "a periodic physiologic state which the body temperature falls to low level approximating that of t ambient temperature, and heart ra metabolic rate, and all other functio fall to correspondingly minimal levels Raymond J. Hock, USAF Arctic Aer medical Laboratory, said the theo has great advantages for space fligh but is not immediately feasible.

Periodic arousal from hibernati is highly desirable, to allow certain a tivity essential to the mission. To pe mit man to hibernate, scientists mu first solve at least four problems: lo ering the body temperature to 10 or below, without the occurrence ventricular fibrillation; ability to mai tain these low temperatures for lo periods, rather than the present lim in animals of a few hours; understan ing of the energy turnover that w allow this condition to be maintain and ability to arouse man to a norm condition periodically.

• **Weightlessness**—Unless cont consoles are properly designed, ported Dr. Harald von Beckh, an o erator under conditions of weightle ness may reach for a button witho looking for it, and find he has t wrong one. This was pointed out citing the importance of vision in o entation. Even this, however, is not great a problem as the disorientati experienced by an astronaut who aw ens suddenly to find himself weightle where there was no weightlessness fore.

NAA's Novel Approach to Stainless Steel Honeycomb Panels

Company sees "new era" in vehicle construction; process includes original heat-treating cycle

by Frank G. McGuire

Los Angeles—North American Aviation, Inc. has developed a new process for producing stainless steel honeycomb sandwich panels for aircraft and potential missile construction. NAA devised its own heat-treating cycle, changed the method of building retorts for fabricating panel sections, and developed a new "roller-skate" device for heliarc welding the edges of the retort.

The new panel is designed to operate in a temperature range of 460°F to 640°F (see Fig. 1), and is constructed with a view toward its use in fabrication of integral fuel tanks. Simultaneous heat-treating and brazing is done in a unique gas-fired porous-brick furnace with eight separate heat-control zones.

• **Special cycle**—The stainless steel alloy used is PH 15-7 Mo CRESS (precipitation-hardening, 15-7 Mo corrosion-resistant stainless steel) with a heat-treating cycle (see Fig. 2) determined by NAA engineers, in preference to that recommended by the supplier. The cycle involves fast uniform heating rates to brazing temperature of 1625°F, where it is maintained for about 18 minutes. Fast uniform cooling is then applied until the temperature reaches 1000°F in about 45 minutes, after which the panel is subjected to −110°F for three hours, then to 900°F for eight hours to the end of the cycle.

According to NAA, the "most critical phase" of the cycle is the rapid cooling from 1625°F to 1000°F in a 45-minute period. "If this rate of tem-

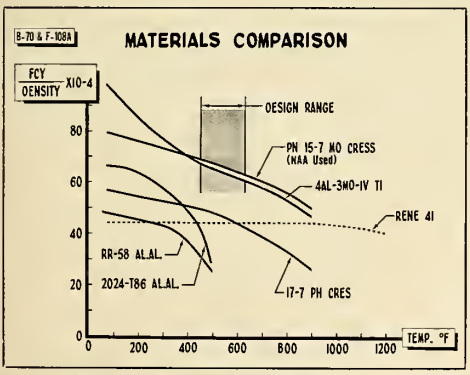

FIG. 1—Superior performance of PH 15-7 Mo CRESS.

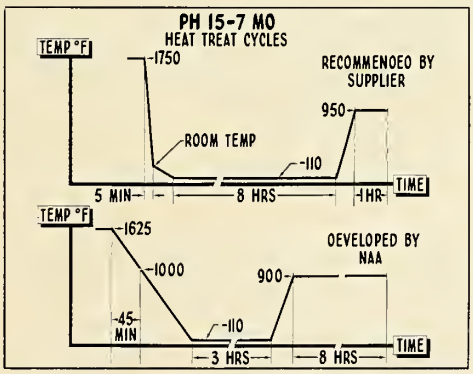

FIG. 2—NAA devised its own heat-treating cycle.

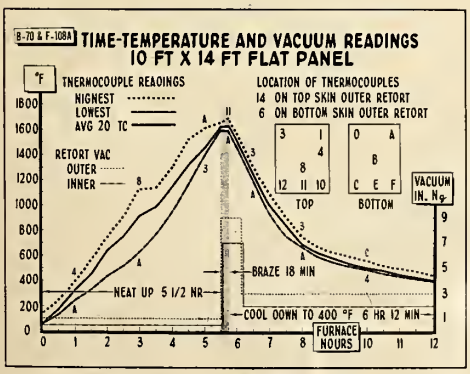

FIG. 3—Big panel exceeded strength requirements.

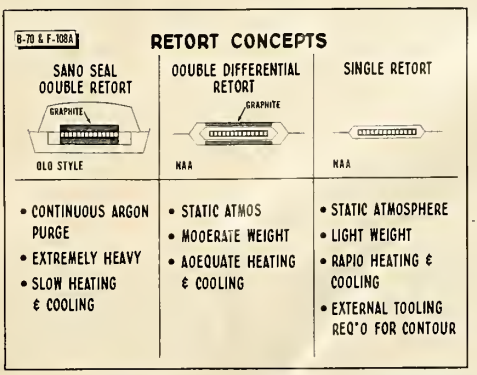

FIG. 4—Graphite removal precluded contamination.

perature descent is not exactly controlled, the panel probably won't be worth much," a company official said. The cooling is accomplished through the use of cold air pumped through the furnace after heat-treating and brazing.

The general operation of this furnace is as follows: a mixture of gas and air is pumped into a plenum chamber between the steel shell of the furnace and the brick internal surface. The gaseous mixture flows through the porous brick and is ignited upon reaching the internal surface. The flow is such that it cools the brick, and although the inside surface temperature of the brick is above 1600°F, this temperature has dropped to 300°F two inches from the inside surface.

To promote cooling at the end of the cycle, the operator cuts off the flow of gas, which terminates ignition, and allows the cool air to continue flowing into the furnace, substantially reducing the temperature. The eight control zones which allow the operator to govern the elevated temperature over any portion of the panel also allow closely controlled cooling during the critical phase.

• **Brazing alloy**—Brazing is accomplished through use of a sterling silver (92½%), copper (7⅜₁₀%) and lithium (⅜₁₀%) alloy which is compatible with the base metal, stainless steel. The copper acts as a temperature gradient equalizer, assuring equal temperature throughout the surface of the panel. The copper used must be phosphorized, or oxygen-free, to prevent blistering of the finished panel.

Before NAA discovered the use of copper in December, 1958, the largest panel which could be made was about six feet square. After oxygen content in copper ruined a $28,000 ten-by-fourteen-foot panel, the company switched to the oxygen-free type. Copper is also used in the inner retort when attached members must be welded to the facing plate of the panel in the retort.

In constructing its largest panel, 10 x 14 feet (see Fig. 3), NAA was required to achieve a minimum yield strength of 200,000 psi (it achieved 227,000 psi), a minimum tensile strength of 225,000 psi (it achieved 242,000 psi), and a minimum elongation of 4% (it achieved 4 to 6½%). X-ray examination of this large panel disclosed 99% brazed bonding between the core material and the facing plates of the panel.

Thermal conductance of the bonding alloy was lowered in order to reduce heat transfer to fuel supplies when structural designs call for using the panel in integral fuel tanks, as in the B-70 bomber and the F-108A interceptor. The brazing temperature was lowered from 1750°F to 1625°F in order to make it more compatible with the brazing alloy's optimum brazing temperature.

• **Graphite is eliminated**—North American also devised a method of eliminating graphite from the tooling needed within the retort, and thereby removed the possibility of contamination (see Fig. 4). In the single-retort method used, the weight of the panel being fabricated is greater than the weight of the retort. This method also provides rapid heating and cooling, a static argon atmosphere (compared with continuous argon flow formerly needed) and simplicity of design.

Edges of the retort are automatically fusion-welded by use of a "roller-skate" device which replaces the hand-operated method. The roller skate mounts a heliarc welding torch and traverses the edge of the retort, fusion-welding it in a short time. This method allows use of the retort a number of times, since it is unnecessary to grind away a great portion of the flange in order to open the retort. The roller skate was conceived and designed by NAA engineers.

• **Ultrasonic inspection**—Inspection of finished panels is done by use of ultrasonics (see Fig. 5). The method was adopted when the company was seeking to reduce the amount of time and money required by X-ray inspection. It previously took one hour for X-ray inspection of one square foot of panel and the cost of inspecting this square foot was $16. The present method handles 14 square feet per hour and costs $1 per square foot (one side only). NAA plans to use multiple inspecting heads on its ultrasonic equipment to greatly increase the inspection rate.

The ultrasonic scanner operates at 18 inches per second, on a width of 1/32". A strip chart recorder reproduces the interior image of the panel on a 1:1 ratio. Defects found are analyzed by a fluoroscope installation, because the ultrasonic scanner can find defects, but not the cause for them. The fluoroscope presents a 3D image enabling the company to determine if salvage or repair of the panel is possible, and if so, how.

Present average size of the panels in production is 6 x 12 feet, but sizes up to 10 x 14 feet have been fabricated. The B-70 bomber will utilize about 20,000 square feet of the panel and the F-108A interceptor will use about 350 square feet. The B-58 Hustler reportedly uses about 1200 square feet of honeycomb sandwich panel.

North American feels that the three most significant advances in state-of-the-art methods inherent in their new system are: removal of graphite from within the retort; use of a static argon atmosphere instead of a continuous flow; and use of copper in the brazing alloy, thus allowing fabrication of large-size panels.

North American foresees the use of the panel in many future high-speed aero/space vehicles. The process, according to company officials, ushers in a "new era" in vehicle construction.

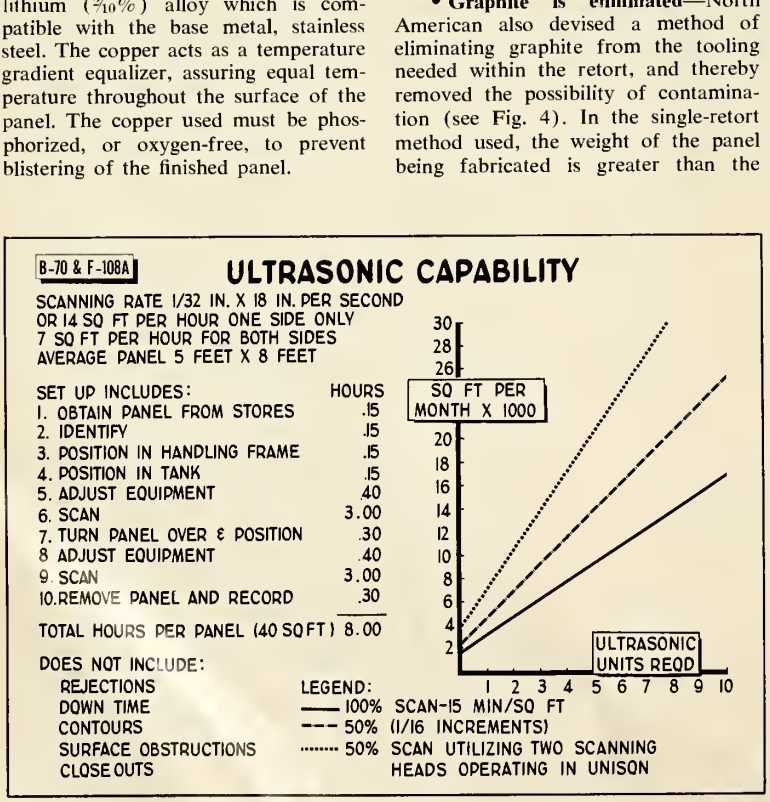

FIG. 5—Panel inspection by ultrasonics instead of X-ray saves in time and money.

MATERIALS FOR ROCKETS AND MISSILES. Robert G. Frank and William F. Zimmerman, 124 pp., $4.50, The Macmillan Company, New York, N.Y.

The new lightweight, high-temperature materials now available for use in missiles and rockets have appeared with such rapidity on the market during the last year that attempts to index and catalogue them have run far behind. This book concisely fills the need of many engineers in the industry to know what present engineering data is on existing metal and ceramic materials, and what materials can be expected to become available during the next few years.

Because of the technical advances in the missile material field and the difficulty that engineers not directly concerned with the development of these materials have in understanding these advances, the book also gives brief descriptions of new ceramic and high-temperature metallurgy techniques.

The book attempts to give a broad cross-section of all the materials available for specific applications, and then recommend the best materials for each use. Conclusion: A handy handbook on materials and metals and a valuable addition to the missile industry library.

METALS FOR SUPERSONIC AIRCRAFT AND MISSILES. D. W. Grobecker (Ed.), 23 pp., American Society for Metals, Cleveland, O.

A compilation of technical papers presented at the Conference "Heat Tolerant Metals for Aerodynamic Applications," at Albuquerque, N.M., in January, 1957, under the joint sponsorship of the Albuquerque and Los Alamos Chapters of the American Society for Metals, and the University of New Mexico.

Eleven papers are included on the various techniques and problems concerned with the metals and ceramics applications to missile development.

Chapter 12 is a summary and evaluation of the papers by J. R. Townsend, previously of the Sandia Corp., and presently a Special Assistant to the Assistant Secretary of Defense for Research and Engineering.

THE UPPER ATMOSPHERE. H. S. W. Massey and R. L. F. Boyd. 326 pp., $17.50, New York Philosophical Library, New York, N.Y.

An account of the experiments conducted and knowledge gained about the upper atmosphere during the International Geophysical Year for students, scientists in other fields, and those technically interested in space travel.

This book has one very unique asset and one distinct liability.

Its authors have been able to explain more of the technical details about both the experiments and the results of the IGY upper atmosphere tests in lay language than any publication to date. They treat mathematical exposition as if it were taboo, and explain in language

Explore new areas at IBM in

Solid state studies are now yielding important discoveries at IBM. Ranging from basic research to product development, solid state projects include a study of the behavior of molecules adhering to a surface in an ordered array. Another project involves the correlation of transistor parameters with circuit transient performance. In magnetics, engineers and scientists are developing a ferrite core which will function normally at 500°C., and a one-million bit memory drum weighing only five pounds. Advanced work such as this requires creative engineers and scientists with inquiring minds and an enthusiasm for investigating the unknown.

At IBM you will enjoy unusual professional freedom and the support of a wealth of systems know-how. Comprehensive education programs are available, as well as the assistance of specialists of many disciplines. Working independently or as a member of a small team, your individual contributions are quickly recognized and rewarded. This is a unique opportunity for a career with a company that has an outstanding growth record.

CAREERS AVAILABLE IN THESE AND RELATED AREAS . . .

Circuit design	Logic	Nuclear physics	Radar circuits
Component engineering	Magnetics	Optics	Reliability
Computer design	Mathematics	Phosphors	Semiconductors
Cryogenics	Metallurgy	Physical chemistry	Systems engineering
Inertial guidance	Microwaves	Physics	Transistors

Qualifications: B.S., M.S., or Ph.D. in Electrical or Mechanical Engineering, Physics, Mathematics, or Physical Chemistry — and proven ability to assume a high degree of technical responsibility in your sphere of interest.

ASSIGNMENTS NOW OPEN INCLUDE . . .

MAGNETICS ENGINEER to design and analyze magnetic core circuitry for use in advanced digital computers. Must understand application of these circuits to logical connectives and systems, and be familiar with basic fundamentals of nonlinear magnetics. Qualifications: B.S., M.S., or Ph.D. in E.E. or Engineering Physics plus 2 to 5 years' experience with magnetic circuits and a strong interest in logical circuit application of magnetics.

CIRCUIT ENGINEER to develop advanced circuit designs based on transistor-diode logic for digital systems; to review new circuits for application in digital control systems and define basic techniques for improving performance characteristics; to participate in advanced analytical studies associated with the application of transistor circuitry to pulse and digital systems. Qualifications: B.S., M.S., or Ph.D. in Electrical Engineering. Minimum of two years' experience with pulse circuitry, transistor circuit design or digital techniques. A knowledge of magnetic devices or solid state physics is highly desirable.

CHEMIST AND PHYSICAL CHEMIST to initiate fundamental studies of the phenomena of surface boundary layers relating to absorption friction, wear, and surface energy states. Qualifications: B.S., M.S., or Ph.D. degree in Chemistry, Chemical Engineering, or Physical Chemistry and suitable experience.

SOLID STATE ENGINEER to carry out applied research studies on precision linear circuitry employing solid state devices. Qualifications: B.S., M.S., or Ph.D. degree plus experience in feedback amplifier and servo design.

METALLURGICAL OR PHYSICAL ENGINEER to handle research and advanced development relating to electrical connections, vacuum melted metals, and thin film techniques. Qualifications: B.S. in Physics or Metallurgy plus extensive knowledge of materials and means of joining metals. Thoroughly experienced with metallograph, photomicrography, and experimental techniques.

PHYSICIST to supervise efforts in integrated circuit development and fabrication using variety of thin film components. Qualifications: Advanced degree in Physics and well-qualified experimental experience.

TRANSISTOR ENGINEER to direct projects dealing with device and process development of transistors and advanced types of multi-element semiconductor devices. Qualifications: M.S., or Ph.D. in Physics or E.E. with 2 years' experience in semiconductor field.

reviews

not requiring advanced knowledge the instruments and vehicles used and the information obtained.

The book has the liability of having been printed at a time when our knowledge about the upper atmosphere was ever-increasing. It was printed before Van Allen discovered the two belts of charged particles, which is the most significant piece of information produced about the earth's atmosphere in centuries. The authors did point out, however, that one urgent problem to be solved was the amount of "concentration of meteoric and micrometeoritic particles in space and in the upper atmosphere."

The book describes the techniques and vehicles used in the investigation of space, such as balloons, spectroscopic devices, sound and radio waves, searchlights, rockets and artificial satellites. Methods used in finding the positions and speeds of rockets and satellites, and of interpreting their coded signals, are explained. Detailed attention is also given to the phenomena of radio fadeout, radio absorption, night airglow, aurorae, meteors, cosmic rays, and currents responsible for magnetic variations.

POWER UNLIMITED! and TOMORROW THE MOON, both by Abraham and Rebecca B. Marcus, both $3.50, both approximately 150 pp., Prentice-Hall Inc., Englewood, N.Y.

Space primers by a husband and wife team which give adequate coverage of the fields in easy to read terms and diagrams. *Power Unlimited!* covers the field of propulsion from jets to ion rockets. *Tomorrow The Moon* starts with the ancient Greeks and projects us out into space by way of Peenemunde, White Sands, and Cape Canaveral.

These are not books for missile and rocket technicians and engineers. They are good books to recommend for friends who would like to know more about the industry and space technology, and for the children and wives of people in the missile and rocket industry who would like to know more about what daddy and husband are doing.

* * *

The National Bureau of Standards *Journal of Research* will be published in four separate sections beginning July 1:

Section A—Physics and Chemistry
Section B—Mathematics and Mathematical Physics
Section C—Engineering and Instrumentation
Section D—Radio Propagation

According to the Bureau, the change is being made to permit better distribution and to better meet the specialized needs of the scientists, engineers, and mathematicians who subscribe. The change will also allow the editorial scope of the *Journal* to be broadened to better cover the Bureau's technical program.

Printing schedules and subscription costs vary among the various sections. Subscriptions may be ordered from the Government Printing Office.

Special Problems of the Monkey-in-Space

by Dr. Earl T. Carter
Ohio State University

COLUMBUS, Ohio—Space medicine scientists are hard at work on the problems involved in placing experimental animals in orbit and returning them safely to earth.

They have found that monkeys—in some respects—present greater difficulties than men.

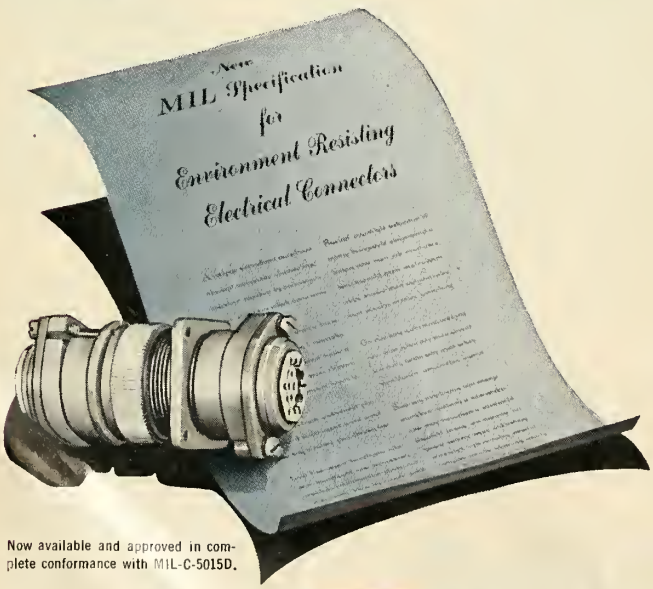
• **Science of balance**—Maintaining the health and normal functions of an animal under sealed environmental conditions involves the science of Ecology, dealing with the process of keeping an energy balance between an animal and its environment.

To achieve such a state of balance it is necessary to know the exact metabolic requirements of an animal—the exact amount of oxygen, water, and food he consumes, as well as the amount of heat he adds to the environment and how this amount compares with the heat input from all possible external sources.

For many years, data has been accumulated concerning metabolic functions of animals such as the monkey. But there is a scarcity of data applicable to the special conditions of space flight. Accordingly, researchers have had to create laboratory capsules in which space flight conditions can be simulated as closely as possible.

Studies of this type are being conducted in laboratories of the Department of Physiology-Biophysics at the USAF School of Aviation Medicine. Here Drs. Hans Clamann and Richard Bancroft are making careful studies of the behavior and metabolic requirements of the spider monkey in experimental sealed capsules. Many unexpected problems have arisen.

• **Drinking problem**—First, there was the key problem of providing liquid to an animal in the weightless state, since drinking in this condition is impossible without special mechanical means. This was solved by development of a special gelatin mixture which is 80% water and is packed with nutritious materials such as peanuts, oatmeal and vitamins. This semi-solid gelatin is contained in small trench-like recesses along the inner walls of the capsule. The monkey can handle and chew it even in the weightless state.



• **Dark confusion**—Another problem unique to such a system is prolonged darkness. A monkey, like a human, is used to sleeping in the dark and eating in the daylight. Prolonged darkness tends to alter many of his habits and even his basic physiological functions. Whether such effects might have deleterious results will be determined by further testing.

• **Overindulgence**—The monkey himself has provided several problems because of his peculiar personality. In early experiments it was found that he tended to eat his entire food supply in one sitting. To overcome this gluttony, a special food dispensing device was designed with a timing mechanism to insure that only a single day's supply of food was delivered at the beginning of each day.

• **Little menaces**—Furthermore, it was found that monkeys are like human children—destructive. In preliminary experiments, they were bored in the sealed capsule and amused themselves by taking everything apart. Ventilation systems were unscrewed and dismounted, power supply cables were chewed through, and measuring devices were otherwise put out of order.

To handle this problem, a sealed system was designed in which no loose object, sensing device, motor, or other control mechanisms could be reached by the busy-fingered simians.

NEW BENDIX MS-R ENVIRONMENT RESISTING ELECTRICAL CONNECTOR

Now available and approved in complete conformance with MIL-C-5015D.

This new connector answers the demand from the aircraft industry for a shorter, lighter and more reliable environment resisting connector. This connector will inactivate practically all other MS types and the Military has assigned a new class letter R to insure incorporation of this better connector in all new designs.

An important reliability feature of the new MS-R connector is an "O" ring at the main coupling joint which provides for the best possible sealing and more positive inter-facial compression and assures complete performance compatibility among all approved MS-R connectors. Establishment of the MS-R connector as the "universal" military connector is testimony to the record of previous MS environmental resistant connectors using resilient inserts as pioneered by this Division. In the Bendix* connector, wire sealing is accomplished by an exclusive slippery rubber grommet which permits convenient wire threading and grommet travel over wire bundles.

Write for more complete information on this latest addition to the ever-growing family of Bendix electrical connectors.

THE U.S. TREASURY SALUTES THE AIRCRAFT INDUSTRY

—and its thousands of employees who help strengthen America's Peace Power by buying U.S. Savings Bonds

Men and women who make up the great group who design, fabricate, assemble and test our newest aircraft are also making another substantial contribution to our national security. Many thousands of them are buying U.S. Savings Bonds, regularly, through the Payroll Savings Plan.

Regular purchases of Shares in America help these patriotic and thrift-minded people set up substantial reserves for the education of their children, the buying of new homes and the building of their retirement funds. Through the Payroll Savings Plan the practice of thrift is made easy and automatic.

If your company has not yet put in a Payroll Savings Plan, start now. Your State Savings Bond Director is anxious to help and to show you how easy it is to put the Plan to work. Telephone him now. Or write to Savings Bonds Division, U.S. Treasury Department, Washington, D. C.

L. A. MARTIN, skilled aircraft mechanic, is typical of the thousands of valued employees in this field who are buying U.S. Savings Bonds regularly. Mr. Martin, through his company Payroll Savings Plan, is making a personal contribution to the Peace Power of his country.

THE U. S. GOVERNMENT DOES NOT PAY FOR THIS ADVERTISEMENT. THE TREASURY DEPARTMENT THANKS, FOR THEIR PATRIOTISM, THE ADVERTISING COUNCIL AND THE DONOR ABOVE.

COVER STORY

$23 MILLION research center ready.

BIRTH OF A *TITAN* NOSE CONE

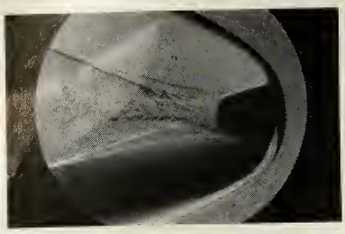
The story in pictures
of previously secret data on nose cone technology
conducted by Avco which is opening new R&D center

WILMINGTON, MASS.—One of the most complete and advanced Space Age research centers in the world will be dedicated here on May 14. Completion of the $23-million center—Headquarters of Avco's Research and Advanced Development (RAD) Division—marks the end of one phase of a phenomenal success story. Less than five years ago the company's research effort on the critical ICBM re-entry problem was begun with only a handful of scientists. Today it has grown to a staff of more than 2500 scientists, engineers, and supporting personnel.

The center will be devoted to basic and applied research and development. One of its most important functions will be continuing work on the ICBM program—primarily, atmospheric re-entry. Avco holds contracts for nose cone work on both the *Titan* and *Minuteman* long-range missiles. The division is also doing significant work in related fields of high-temperature gas dynamics, magnetohydrodynamics, metallurgy, materials research, and environmental test methods. Division scientists began research during the last year on the anti-ICBM problem.

The decision to put Avco into Space Age work was made by Victor Emanuel, chairman of the board, in 1955. Since that time the Research Division has become the company's "greatest instrument of growth." While its primary work is concerned with missile programs, it also provides a pool of talent and facilities for other Avco divisions. It aims for the kind of scientific breakthroughs upon which totally new products, and sometimes new industries, are built.

Corporate funds support research in many fields. Work is under way in propulsion, radar, guidance, gas dynamics, nuclear energy, navigation, communication, fire control, and electronic computers.

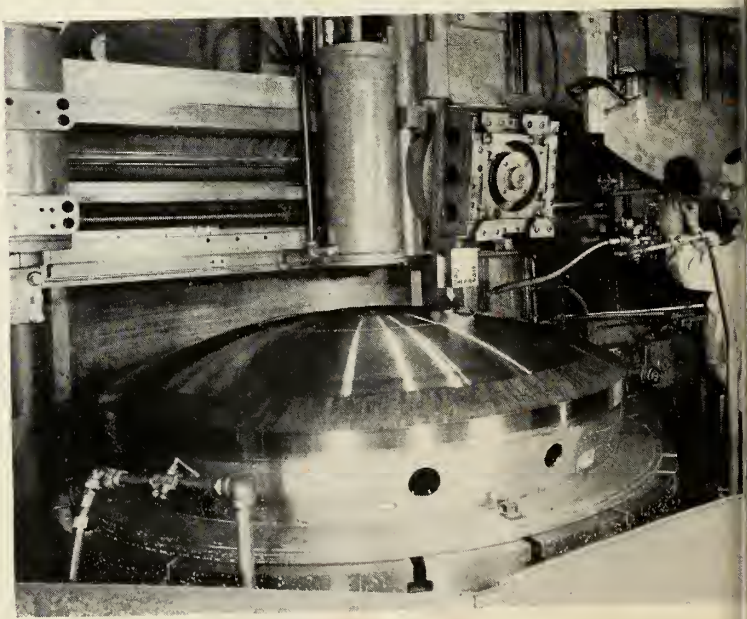


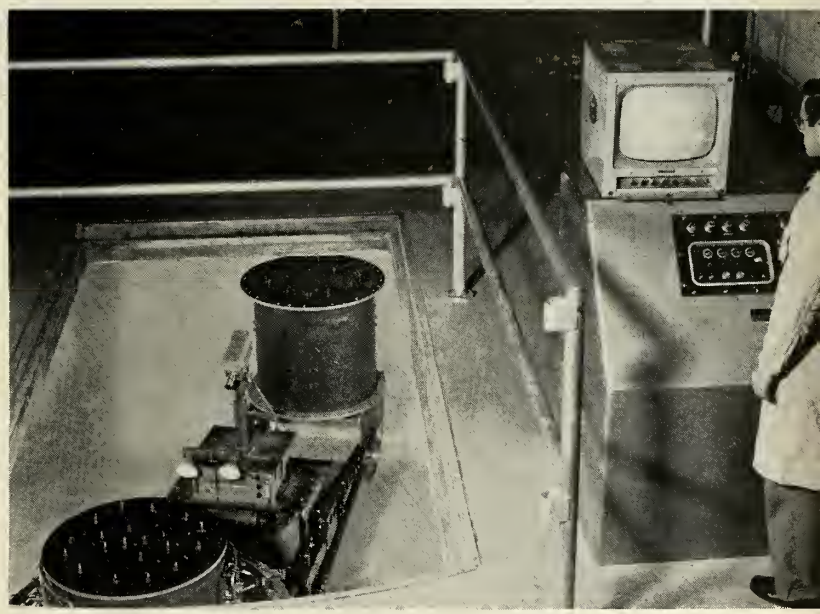
The president of RAD is James Kerr. He helped form the new group when the decision was made to bring the company into the space business. At that time he was head of Avco's Office of Defense Planning.

A vice-president of Avco and director of the Research Laboratory since its founding, Dr. Arthur Kantrowitz, has had the responsibility of gaining experimental data on Mach 25 flight—a prerequisite to solving the problem of atmospheric re-entry.

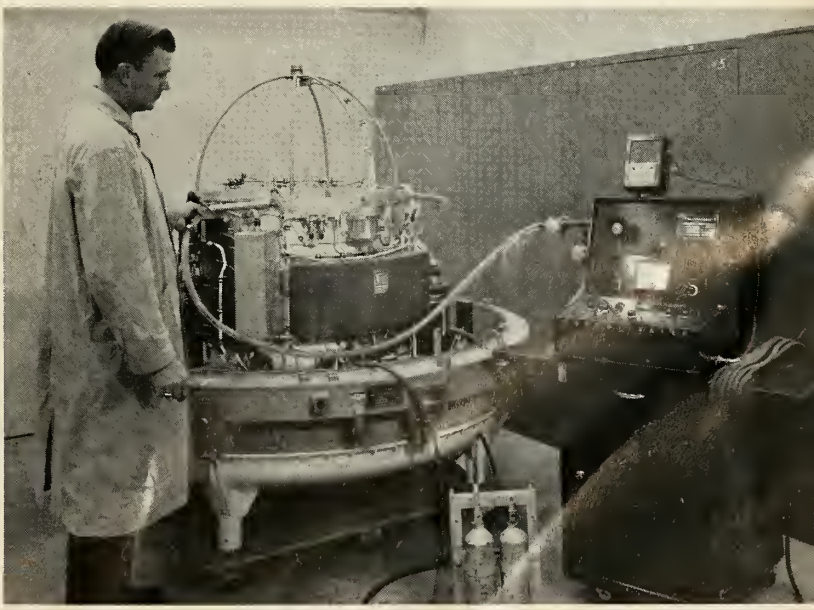
Project director of the *Titan* nose cone program is Dr. Jack A. Kyger. He was once the top scientist in the Navy group that rushed the nuclear-powered Nautilus to successful completion.

The following pages show some of the division's work on the re-entry nose cone—how it is made and tested and some of the vital components that go into the final system. Many of the just-released photographs show details never before published.



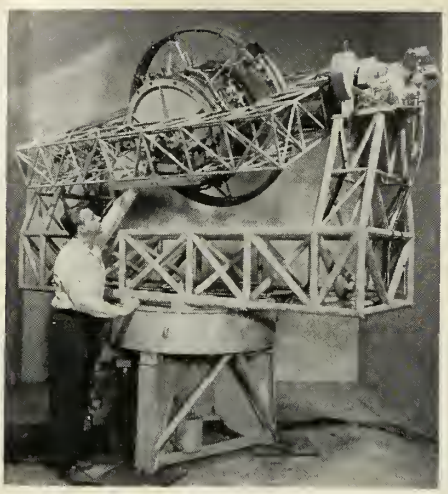


PRELIMINARY WORK on the *Titan* nose cone begins with schlieren studies of stock wave and wake turbulence of actual cone shape test model.

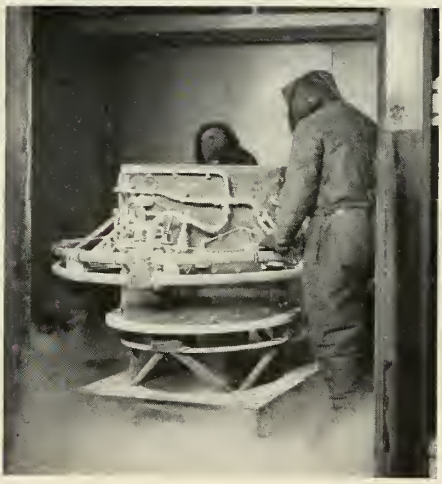


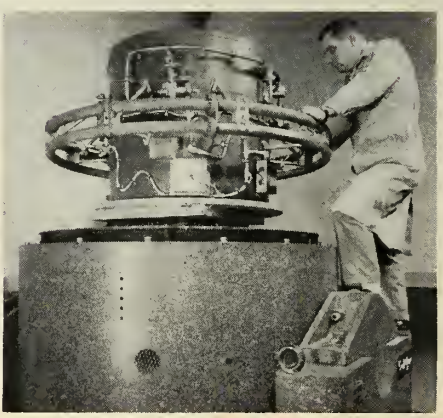
THE FACE of the heat-sink nose cone is milled to the extreme tolerances required for successful re-entry.

. . . and nickel-plated and finished to mirror smoothness to minimize atmospheric friction.



COMPONENTS ARE SUBJECTED to 100g acceleration tests and watched by closed-circuit television for signs of failure.





THE INTERNAL SYSTEMS receive final pressure check before final assembly.

THE AVCO DARAC—which aligns the nose cone to the proper attitude to re-enter the atmosphere—is tested on the three-axis flight simulator

. . . and on the shake table which simulates rocket-engine vibration

. . . and subjected to the extreme cold of outer space.

The men who guide Avco research . . .

James R. KERR
Vice-president, Avco Corp.
President, Lycoming Div.
President, Res. & Adv. Dev. Div.

Dr. Arthur R. KANTROWITZ
Vice-president, Avco Corp.
Dir., Avco Res. Lab.

Dr. Jack A. KYGER
Vice-president & Tech. Dir., RAI
Proj. Dir., *Titan* nose cone

AT THE END OF THE LINE the completed vehicle receives a final vibration check before shipment to a *Titan* test site to make its contribution to space technology . . .

Communications Satellites:

A Largely Neglected Force for Peace

Long-proposed space relay system, now technically and economically feasible, still gets little non-military attention

by Hal Gettings

WASHINGTON—Satellite communication relay stations—the first practical application of space research to non-military pursuits—could be close to reality. Several significant problems still stand in the way—notably, satellite life and reliability. But according to D. M. Culler of ITT Laboratories, the system could be implemented in the very near future.

Actually, such a system was proposed 14 years ago by English scientist A. C. Clarke, who has stated that "the TV satellite is mightier than the ICBM. It may well determine whether Russian or English is the main language of the future." Dr. Louis G. Dunn, president of Space Technology Laboratories, has predicted that communications satellites "will have more direct effect on the man in the street than any other development in space technology."

The first step in such a project has been made with the *Atlas* SCORE, which successfully received and retransmitted voice messages back to earth. But what is being done to further the program?

Nothing, actually, so far as a non-military system is concerned. Althou the first sentence of the Space A declares ". . . it is the policy of t United States that activities in spa should be devoted to peaceful pu poses for the benefit of all mankin only a military system is being work on at present.

The military program (which d not include TV is going forward joint effort of ARPA and NASA. low-altitude *Courier* is scheduled 1960 and a higher-altitude satellite 1962. These are delayed-repeater s tems, however, and will handle only channels of teletypewriter code inf mation. Within 5-6 years they hope have a 24-hour system in orbit. T system will have an increased co munication capacity of up to 144 vo channels.

No budget figures are available approximately $50-60 million per y is being scheduled for "communi tions." Although the problems are qu different and the military system complex than the "commercial" v sion, knowledge gained by the milit should contribute to success of a pea ful project.

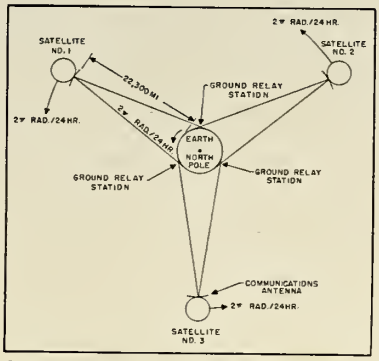
• **System concept**—The system p posed by Culler consists of three re stations mounted in satellites each a 24-hour orbit so as to remain fi over a specific spot on earth. Prop maintained in these locations, the tions would allow line-of-sight c munications with 98% of the ear surface. Culler says the cost of suc system would be competitive with j sent transoceanic cable systems, wh incidentally, are not adequate to har the wide bandwidth required by t vision.

The satellites, with active repeat would orbit in the equatorial plan

TABLE I: MAJOR SYSTEM DESIGN PROBLEMS

PARAMETER	LIMITATIONS	SYSTEM REQUIREMENTS
1. LIFE	Component State-of-the-Art Control Propellant Supply	1-2 Years Minimum
2. RELIABILITY	No Satellite Maintenance	No Satellite Failure Redundancy
3. COMMUNICATION SUBSYSTEM		
a. Coverage	Line-of-Sight 3 Satellites—98%	Depend Upon Application
b. Frequency	Ionosphere Effects Atmosphere Effects	1000—10,000 mc
c. Capacity	Weight Bandwidth Power Modulation	Voice, Teletype, TV
d. Satellite Transmitter Power	Weight Electrical Power Supply	Directional Antenna High Power Efficiency
e. Ground Receiver Sensitivity	Noise S/N Ratio Modulation Technique	High Antenna Gain Parametric Amplifiers
4. VEHICLE SUBSYSTEM		
a. Payload	Rocketry State-of-Art	V = 10,070 ft/sec h = 22,300 mi
b. Ascent Guidance and Control	Multiple Orbits Planar Transfer Guidance Blackout	$\Delta V = \pm 5$ ft/sec $\Delta a = \pm 0.1°$
c. Orbit Guidance and Control	Moon-Sun Gravitation Light Pressure Dumbbell Effect Internal Moments Antenna Beamwidth	$\pm 0.1°$ Latitude and Longitude $\pm 4°$ Attitude Control
5. ELECTRICAL POWER SUBSYSTEM	Weight Surface Area Solar Collector State-of-Art	Maximum Energy Conversion Efficiency

n altitude of 22,300 miles, as shown
the illustration. By stationing one
f the three satellites every 120 de-
ees about the orbit, it is possible to
rovide almost complete global cover-
ge with line-of-sight communications
rough the addition of the three indi-
ated ground relay stations in the line-
f-sight overlap areas. All but 2% of
e earth's surface is covered by such
system. Only limited areas about the
rth and south poles are below the
nes-of-sight horizon with respect to
e satellites in the equatorial plane.



The angle subtended by the two
ngents to the earth's circumference
om the satellite is approximately 17
egrees; thus, the coverage indicated
ill require a satellite antenna beam-
idth of at least 17 degrees.

With only two satellites, one over
e Atlantic and the other over the
acific, most of the free world can be
overed by microwave broad band
ommunication capable of handling
any channels of telephone, teletype,
nd television transmission. With three
tellites located as indicated, and the
ree ground stations at, for example,
thens, Tokyo, and Houston, complete
orld-wide coverage is obtained except
r minor polar regions. With appro-
iate ground networks it would be
ssible to establish a world-wide dial
lephone system as one application of
e satellite repeaters.

• **Problems**—Two of the biggest
oblem areas are life and reliability.
order for this communications sys-
m to be economically feasible the
tellite must operate continuously for
minimum of one to two years, plac-
g a tremendous burden upon com-
nent life. Actually, the functional life
the satellite is primarily dependent
on two factors: 1) life capability
alizable within the component state
the art, primarily electronic com-
nents; and 2) the supply of control
opellants that can be carried to main-
in the satellite on station and in
oper attitude.

In reliability, the major limitation
that there is no opportunity for main-
nance of equipment—it must exhibit
overall failure during its life. This
viously places a strong requirement
component reliability and the need
r redundancy.

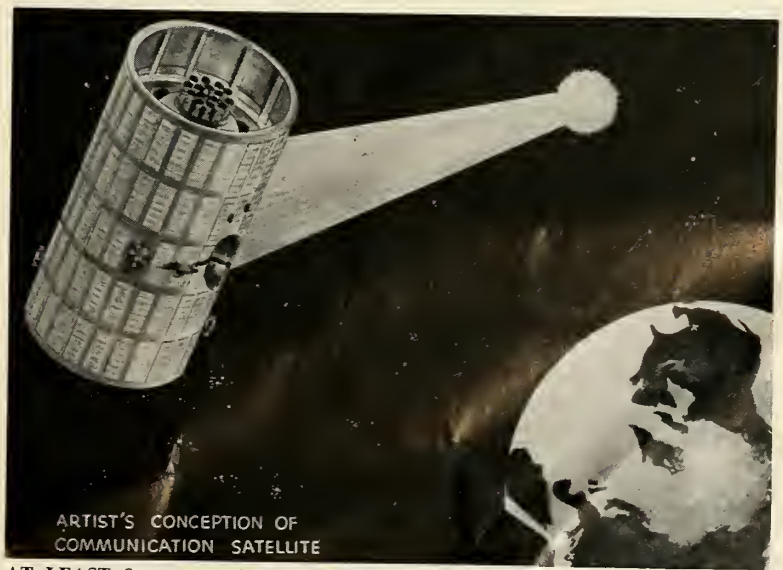
Three development problems re-
ire particular consideration. But none

ORBIT location of 24-hour satellites.

of these necessitates any major breakthrough; they need only extension and refinement of existing equipment and techniques.

1) Reliable satellite-borne equipment with sufficient power supply to operate high-power transmitting and receiving equipment.

2) Guidance and control systems to place and maintain the satellite in proper orbit and attitude.



3) Increased satellite payload capacity.

• **Communication subsystem**—In the design of the communications subsystems two parameters are most influential: ground receiver sensitivity and satellite transmitter power output. Current rocketry imposes a low limit on the payload that can be put into a 24-hour orbit. Therefore, it is desirable to maximize the capability of reception on the ground in order to minimize the satellite transmitter power output.

With parametric amplifiers, receiver noise figures of 0.5 to 1.5 db are possible. Also, recent improvements in modulation techniques allow efficient utilization of these noise figures at high channel signal-to-noise ratios to make possible both high sensitivity and signal quality in the ground receiver within the present state of the art.

The satellite transmitter power output requirement is a function of the path loss and the ground station sensitivity. Since the satellite transmitter power is limited by payload weight and electrical power supply, the maximum communications capacity of the system is a function of the minimum power level detectable by the ground station (maximum sensitivity) and the maximum power output of the satellite transmitter.

The other link of the communication path from the ground to the satellite is not a limiting factor, since the ground transmitter power has consider-

AT LEAST five communication satellites—two within polar orbits—are needed for world-wide communications.

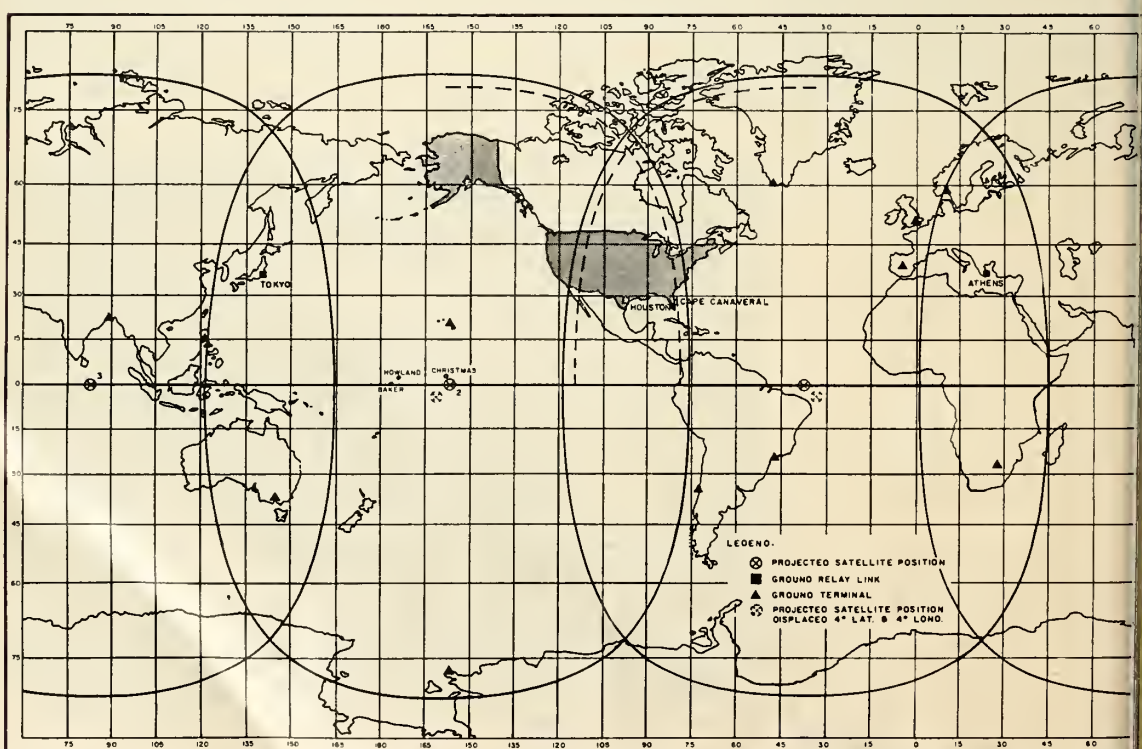
able latitude under present capability.

• **Satellite position and attitude**—Once the satellite is in its appropriate orbit, it must be maintained on station and in proper attitude. Here a limitation is the satellite antenna, which must be directional and of minimum beamwidth to cover the necessary area. The vehicle must be referenced to the earth's vertical as closely as possible.

The vehicle is constantly subject to such perturbating forces and torques as the moon-sun gravitational field, light pressure, dumb-bell effect, and internal moments. Considering the moon-sun gravitation, light pressure, and residual drift rate, the position of a satellite can be controlled within approximately one-tenth degree latitude and longitude. Considering best estimates of torques due to light pressure, residual magnetism, induced currents, and the dumb-bell effect, attitude can be held to within ±4 degrees of nominal about all three axes.

At present, very little data is available to accurately define the forces and torques that will cause these perturbations. It therefore cannot be overemphasized that the guidance and control during both ascent and orbit phases is a very significant problem.

• **Power system**—The electrical power system is limited in capability by the weight and surface area available in the satellite payload and the efficiency of the solar collectors. In the immediate future the primary source of energy for the satellite will be solar energy with batteries used for energy when the satellite is in the earth's shadow. In the long term, nuclear and other energy sources will be used in space vehicles for electrical power.



The recent development of the "plasma thermocouple," for example, offers significant promise for a space power source. Furthermore considerable improvement of the solar collectors can be expected in the future.

• **Economic considerations**—From an economic point of view, it is interesting to note that the communication satellite system is rapidly becoming quite competitive with the cost of transoceanic cable systems. For example, current transatlantic cable costs are approximately $200 per voice channel mile. A 96-voice channel satellite repeater system feasible within the immediate future for Atlantic Ocean coverage only would cost approximately $300 per voice channel mile even compensating for a 2-year life for the satellite as compared to a 20-year life for the cable.

Furthermore, present cable systems are incapable of handling conventional television transmission due to the 4.5 mc bandwidth requirement.

Estimates indicate that a complete global 24-hour active satellite communication system would cost, under present state of the art, approximately $100-300 million. Thus, the system ap pears economically feasible for the in mediate future. On the longer term, is quite probable that it will be th most economical means of long-rang broadband transmission. Anticipate improvement in payload and reliabili of rocket systems leads to a very opt mistic viewpoint on future system cost For example, while only two years ag it cost approximately $1-million fo every pound of payload in low-altitud orbit, it is expected that by 1960 th will have been reduced to $1000 an by 1964 to $100 per pound. Althoug these figures refer to low-altitude orb conditions, they do reflect the rate improvement in rocketry costs to b expected in the future.

• **Conclusions**—Cruller's argumen provide strong support for the 24-hou satellite as a major breakthrough long-range broad bandwidth commun cation capability as a time when com munication channels are rapidly reac ing capacity. Through increased worl wide communication—particularly tel vision—made possible by such a syste the interests and social customs of th various countries of the world will closer bound together and the univers brotherhood of man brought near Thus it is very possible that the com munication satellite will be the fr world's best instrument for peace. T day's technology can bring it about the very near future.

IR Analyzers Monitor Giant Wind Tunnel

TULLAHOMA, TENN.—To monitor and control explosive gases and fumes in the U.S. Air Force's giant transonic and propulsion wind tunnel at Arnold Engineering Development Center here, a system of 16 infrared analyzers is used.

Built by the Perkin-Elmer Corp., the analyzers are located at critical points around the tunnel with a sample-collecting line running from each unit into these areas. Recorders and indicating dials for each unit are centrally located on one panel in a test control building.

In operation, the analyzers continuously monitor conditions in their area. When an explosive concentration reaches 25% of the lower explosive limit, an alarm is set off. If the concentration reaches 50% of the lower explosive limit, the instrument automatically initiates shut-down of fuel and reduction of power input to the tunnel compressor. It also activates equipment that fills the tunnel with nitrogen.

Unlike the more common open-end wind tunnels, the AEDC tunnel is a completely closed system. Fuel can collect in several ways during testing of jet and rocket engines, and this build-up, if it went unchecked, could become a serious danger to personnel and to the expensive structure itself.

• **Critical areas**—Fuel is pumped into engines under test at rates up to 25 gallons per minute. At this rate, even a small leak can result in a sizeable build-up of fumes. There is usually a small amount of fuel spillage from engines, and, since they are tested up to stall, some fuel is not burned.

To handle the great quantity of fuel needed in tests, a special test-fuel building serves as a storage area. Here a certain fraction of leakage is to be expected. Fumes also collect in the below-ground foundation of the main test area.

A serious leak or fume collection in any one of several of these areas could lead to a damaging explosion. The infrared analyzers guard against such a situation.

• **Operation**—The analyzer instruments are sensitized to analyze a number of different fuel elements: JP fuels 1, 2, 3 and 4; kerosene; alcohol; methane; aviation gasolines and rocket fuels. The analyzers can detect the lower explosive limit for the most explosive member with an accuracy of ±5%. The instruments indicate the tunnel contents with a response time of six seconds.

The instruments are designed to operate with a high degree of accuracy and with as fast a response time as possible under the unusual conditions found in the wind tunnel. The instruments analyze vapors which can exist under widely different environmental conditions: temperatures ranging from −10° to 230°F, velocities varying from 0 to 200 feet per second, and altitude pressures ranging from sea level to more than 100,000 feet.

To achieve reliable operation under such conditions required unique design, especially in the sample handling, according to Perkin-Elmer. The fast response time called for an unusually large sampling capacity. Despite the wide range of pressures, the pressure in the instrument's sample cell is held constant within 5%.

• **The development center**—The Arnold Engineering Development Center was established for the development and evaluation of aircraft, propulsion systems and guided missiles.

The wind tunnels and test cells of AEDC, by simulating the conditions of actual flight, provide a precise, safe and economical means for determining effects of speed, temperature, pressure and altitude on engines, aircraft and missiles. The facilities of the AEDC can test the largest engines under development or on the drawing boards, as well as scale model and full-size aircraft and missiles.

Ionosphere Reported Bigger Than Supposed

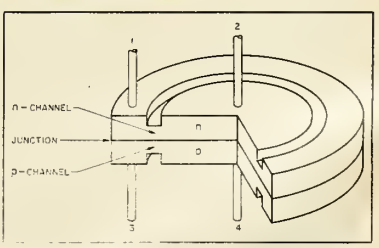
COLUMBUS, O.—According to T. Gordon Hame, scientist at the Antenna Laboratory of Ohio State University, the ionosphere extends thousands of miles further out into space than was previously supposed. Previously it was thought that the ionosphere, which begins about 50 miles above sea-level, extended upward to about 300 miles.

Hame said the electrons in the ionosphere reach their greatest density at a point about 300 miles above the earth, and from there outward the electron density tapers off gradually.

He said that at an altitude of some 200 miles, the density is about 10^{12} electrons per cubic meter. At 1000 miles out in space, the density has dropped only to 2×10^{11} electrons per cubic meter.

He said this probably means that kinetic temperatures in the exosphere (which is considered to encircle the earth above an altitude of some 625 miles) are much higher than previously was thought. It also means that the ionosphere extends outward into what has been called the exosphere.

These conclusions were based in part on data obtained by Hame while working on a research project sponsored by the Wave Propagation Branch of the Wright Air Development Center's Aerial Reconnaissance Laboratory at Wright-Patterson Air Force Base, Dayton, Ohio.



The Ohio State engineer said that beyond an altitude of 200 miles, real kinetic temperatures would increase five times within 700 miles on an outward space journey.

Hame, who is assisted by three graduate students, has described some of his findings in a report to be published in the Institute of Radio Engineers Proceedings. The research team has been listening to *Sputnik III* since last July on a radio frequency of 20.005 mc. (This Russian satellite was chosen because its orbit is farthest from the equator.) Since January, he also has been listening to the Soviet satellite's second harmonic on 40.01 mc. This, he said, cut down the margin of error in measuring the electron density to about 2%.

Hame said when the satellite's radio signals pass through the ionosphere, the effect of the earth's magnetic field and the electrons polarize the signal. By measuring the time difference between the polarized peaks on recording graphs, he and his associates are able to work out mathematically the electron density in space.

The researchers tune in on the satellite's beeps some five hours each day, and collect more than 25 feet of recorded data daily.

—Bell Tetrode—

A FOUR-TERMINAL semiconductor device—a field-effect tetrode—has been invented by Bell scientists. The device is unlike tubes or previous transistors and will act as either a transformer or a gyrator—functions normally available only with extensive circuitry. The cutaway shows construction of the unit, an etched disk of semiconductor with a diffused junction.

Fluorine Engines May Arrive Within Five Years

Dramatic increase in rocket capability will come when compatible materials are developed. Fuel supply considered more than adequate

by Paul Means

WASHINGTON—Time and money are the only two factors needed to produce a rocket engine using elemental liquid fluorine as its oxidizer—the ultimate chemical propulsion system for space vehicles.

Chemists need time to find materials, compatible with fluorine under operational conditions, to be used for such a rocket's gaskets, joints, seals and lines.

And many of the nation's chemists and rocket makers think that more of the second factor—money—would cut down on the time it takes to find the compatible materials.

The technology needed to produce a fluorine engine is here. This was demonstrated as long ago as 1949 when the NACA Lewis Research Center at Cleveland operated a small engine with it. It was dramatically demonstrated recently when the Bell Aircraft Corp. field-tested a large fluorine engine.

Fluorine engine research is presently being carried on at Bell, Lewis, JPL, and the Rocketdyne Division of the North American Aviation Corp. Lewis has a new $2.5-million facility designed to handle fluorine rocket engines up to 26,000 pounds thrust, and received more money in the Fiscal '60 budget to carry on fluorine engine development.

Bell recently received a $1,070,000 contract from NASA to carry on its fluorine engine development program originally funded by the Air Force in 1956. NASA has asked Bell to determine "feasibility of a high-energy fluorine-liquid hydrogen rocket engine."

If the problems of handling fluorine and finding materials compatible with it are solved, a high-energy upper-stage fluorine engine could be produced within very few years.

• **Pioneer**—And the company most likely to solve many of these problems is not in the rocket engine business at all. The General Chemical Division of the Allied Chemical Corp. is a pioneer in production and handling of fluorine, the major producer of fluorine, and the only producer selling elemental fluorine to the missile and rocket industry.

It was not practical to produce great quantities of elemental fluorine, or to consider it as a likely oxidizer for a rocket engine, until General Chemical found a way to economically transport large quantities in 1957. (M/R, Sept., 1957.)

Prior to that time, ICC regulations restricted shipment of the gas to six pounds of fluorine in a 200-pound cylinder under 400 pounds of pressure.

Now, General Chemical's tanks can transport 5000 lbs. of elemental liquid fluorine at a time.

In order to eliminate the problem of fluorine burn, the seamless tanks are first cleaned to remove all impurities, and then filled with gaseous fluorine. The oxidation of the fluorine with the metal forms a coating of iron fluoride. Then the liquid fluorine i very slowly bled into the tank until i displaces the gaseous fluorine.

With the shipping tank and carefu handling, General Chemical has ha good success in transporting larg amounts of fluorine from its Metropolis Ill., and Baton Rouge, La., plants wit a negligible number of accidents.

• **The big problem**—The grea problem in handling fluorine, in pro duction, transportation, or rocket de velopment, is that it is the most powe ful oxidizing agent known, reactin with practically all organic and in organic substances. The few exceptior are the inert gases, metal fluorides, an a few pure completely fluorinate organic compounds.

And the problem becomes formi able when the rocket experiments a taken out of the static conditions of th laboratory into the field.

Bell's engine uses no gaskets ar as few joints as possible. Joints cann be welded with such smooth consis

FEASIBILITY of transport of large quantities of highly-toxic liquid fluorine has be demonstrated by Allied Chemical.

ency that nodules do not form, leaving imperfections that cannot be protected so easily by a fluoride.

Gasketing in fluorine rocket engines with present materials is risky. General Chemical, when it must use gaskets in production and transportation of fluorine, uses pure soft aluminum, which has the necessary give.

Fluorocarbons, though satisfactory with gaseous fluorine, break down when used with liquid fluorine under operation friction or pressure. The eventual gasket materials for fluorine engines, however, will probably be improved fluorocarbons and/or silicons.

Another problem which must be overcome is the finding of lubricants compatible with fluorine.

General Chemical says it has had success in handling fluorine at room temperature with nickel, monel, steel, stainless steel, brass, copper, aluminum and magnesium. At elevated temperatures, the use of nickel and its alloys and stainless steel is preferable. For all-around applications at low and high temperatures, General Chemical likes monel.

General Chemical has also used tetrafluoroethylene polymer for valve packing.

• **Potentials**—When chemists solve the last major problem impeding the progress of fluorine engines—that of finding compatible materials—rocket manufacturers can look forward to developing engines that can lift payloads 70% heavier than any space vehicle now on the drawing board.

A fluorine-hydrogen engine will give a specific impulse of 463, and yield 5,800 B.T.U.'s per pound.

Such a rocket, according to John L. Sloop, Chief of the Rocket Engine Branch at Lewis, could lift into space a 20,000 lb. manned satellite with half the booster weight and half the thrust of current propellants. On a trip to the moon and return, according to Sloop, the fluorine-hydrogen rocket could increase the ratio of payload weight to take-off weight eightfold over what can be done with today's propellants.

• **Ample fuel sources**—Because of the facilities of General Chemical and other manufacturers producing fluorine, and General Chemical's ability to transport the oxidizer, the advent of fluorine engines in large-scale production will find the fuel waiting for them.

General Chemical began producing large quantities of elemental fluorine for conversion into uranium hexafluoride, which the AEC buys for nuclear work. The U.S., Canada and Mexico have ample reserves of fluorspar which could more than take care of any expanding need for fluorine.

• **Cost justified**—In comparison with present fuels, the cost of fluorine is high. Present prices start as $3.75 a pound and range down to $2.65 a pound f.o.b. in lots of 100 tons per year. General Chemical believes that use of liquid fluorine in operational missiles in the future would bring the price down to $1.00 a pound in large quantities. Liquid oxygen, by comparison, costs only 10 cents a pound.

But the reduction of cost effected by the increased thrust and lower weight of a fluorine rocket would more than make up for the more expensive oxidizer, making the entire rocket less expensive to build.

• **Fluorine bases**—As the fluorine engine approaches operational status, missile and rocket men will have to solve the final problem: How do you fire a fluorine rocket safely?

Missile experts say a fluorine engine cannot be fired from any of the present missile bases or any now on the drawing board.

In case of a misfire or a topple in which fluorine spills out of the rocket, the resulting reactions could endanger not only the crew but surrounding installations.

It is felt that the safety precautions and materials developed in the construction of a fluorine engine would solve many of the problems connected with firing the rocket. Launching pads would probably have to be widely dispersed and automatic controls refined in order to handle the powerful oxidizer.

Judging by the rapid improvement in the techniques of handling present-day liquid engines, the problem of handling a fluorine engine does not seem to be insurmountable. *Thors, Redstones* and *Jupiters* are now handled operationally by troops in the field only a few years after the first experimental firings of large-thrust liquid rockets.

Such high-energy engines would probably be used for scientific exploration of space rather than for military missiles, reducing the need for mass firing techniques.

• **How soon?**—How far away is a fluorine rocket? The best guess is five years. But more research on materials compatible with fluorine could cut the time considerably.

And development of such a rocket would provide the nation with a rocket powerful enough to meet all needs until nuclear and even more exotic forms of propulsion are developed.

Austenite Lowers Steel Fatigue Strength

WASHINGTON—Austenite in amounts up to 10% lowers the fatigue strength of high tensile steel, research by the National Bureau of Standards has demonstrated.

Experiments also showed that retained austenite in the matrix is transformed by fatigue stressing into untempered martensite. NBS said this "probably accounts for the deleterious effect," which may find use in the processing of steel for missile casings.

Four different low-alloy steels, SAE 4340, Tool Steel No. 1, Tool Steel No. 2 and SAE 52100, with carbon content ranging from 0.44% to 1.06%, were investigated.

For each steel, the NBS said, adjusted fatigue strengths decreased as the amount of retained austenite increased. However, for the three higher-carbon steels there appeared to be a "limiting value of approximately 10% beyond which no further decrease in strength occurred."

Specimens refrigerated before tempering had greater fatigue strengths, indicating that refrigeration tends to cut the amount of retained austenite.

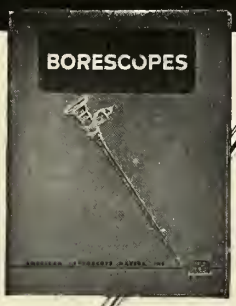
FIRST LARGE-SCALE test of rocket using liquid fluorine has been accomplished by Bell Aircraft Corp.

PUCKETT

Two scientists from the senior staff of Hughes Aircraft Co.'s research and development laboratories in Culver City, Calif., have been named to sit on National Aeronautics and Space Administration advisory committees. **Dr. Allen E. Puckett,** Hughes vice president and director of the company's systems development laboratories, has been appointed to NASA's committee on control, guidance and navigation. Dr. Puckett, an authority on aerodynamics and guided missiles, was chief of the wind tunnel section of the Jet Propulsion Laboratories at CalTech. **Dr. Leo Stoolman,** manager of Hughes' aerodynamics department, will join the NASA committee on structural loads. He is a former senior staff engineer of the Jet Propulsion Lab and author of technical papers on aerodynamics.

Two top executives and a director were elected at a board of directors meeting of Kearfott Company, Inc., subsidiary of General Precision Equipment Corp. **Donald W. Smith** is the new chairman of the board. **Fred D. Herbert, Jr.,** is president and **Robert N. Brown** was elected director. Smith, who has been Kearfott's president since 1955, was recently elected president of General Precision Equipment. Herbert, son of the late founder and first president of Kearfott, has been associated with the company since 1932, when he helped develop the first successful automatic radio direction finder. He is also a vice president and director of General Precision Equipment. Brown, who joined Kearfott in 1946, is vice president and assistant general manager, and manager of the company's newly-established Avionics Operations group.

BARTLEY



The Gabriel Co. has announced plans for immediate construction of a solid fuel manufacturing plant at Mesa, Ariz., and appointment of **Charles E. Bartley,** former founder and president of Grand Central Rocket Co., to head Rocket Power, Inc., a wholly-owned subsidiary organized to operate the new plant. In 1954 Bartley founded Grand Rocket Co., which was sold to Tennessee Gas Transmission Co. in 1958 in a reported $6,000,000 transaction. Earlier, he was chief engineer of the solid rocket division of CalTech's Jet Propulsion Laboratory.

USTIN

George Ustin fills the newly-created post of vice president in charge of engineering at Buchanan Electrical Products Corp., subsidiary of the Elastic Stop Nut Corp. of America. New products currently in the planning or development stage have brought the company into the space and aviation fields. Ustin was formerly with Continental Copper and Steel Industries and holds a number of patents on electrical components and devices.

The Daven Co. announces appointment of **Emil Kohler** as project engineer in charge of development on transistorized power supplies and equipment. Kohler formerly worked for the Bogue Electric Manufacturing Co., where he was responsible for electro-mechanical, ultrasonic, and semiconductor development. He also was installation and service supervisor for the RCA Service Co. and supervisor of the prototype section of the ESC Corporation.

INSPECTION PROBLEMS?
This booklet is for you!

This comprehensive, elaborately illustrated booklet provides practical information on the use of the famous A. C. M. I. Borescope in various industries, for the inspection of interior areas or surfaces not otherwise visible—together with full data on the types of Borescope available, and on their care and maintenance. Have you received your copy?

contract awards

WASHINGTON—The Convair Division of General Dynamics Corp. has been given the $33.5 million NASA prime contract for *Vega*, a two or three stage rocket with *Atlas* as its booster due for test flights by mid-1960.

The 295,000 pound *Vega*, capable of putting 5000 pounds into an earth orbit, will consist of an *Atlas* first stage, a modified *Vanguard* booster as the second stage, and a 6000-pound-thrust encapsulated nitrogen tetroxide and hydrazine engine as its third stage. The General Electric Company has the second stage contract, and JPL is responsible for the third stage, technical supervision, and payload planning.

Convair will have the responsibility for design, construction, tests and launching of the vehicle. The contract does not include the cost of the *Atlas* boosters.

NASA

$1,992,848—Doyle and Russell, Norfolk, Va. for two launching pads.

MISCELLANEOUS

$4,340,000—Sylvania Electric Products, Inc., New York for production on new communications system; fourth "significant" recent multi-million-dollar award—details not available because of security classifications.

$1,500,000—Aeronutronic Systems, Inc., Allied Research Associates, University of Chicago, Convair Div. General Dynamics Corp., General Electric Co., General Mills, Inc., Hughes Aircraft Co., Industrial Research Associates, Ramo Wooldridge Corp., RCA, Republic Aviation Corp., Technical Operations, Inc., for research and study of *Project Defender*.

NAVY

$761,751—Aerojet General Corp. for *Jato* rocket motors and 17 spare igniters.

$239,785—AL-CO Co., Inc. for construction of communication transmission feeders at Naval Missile Facility, Point Arguello.

$3,718—Walker Electrical Co., Inc., Atlanta for switchboards.

$50,400—Standard Electric Contracting, Inc., for construction of a KDA facility at Naval Auxiliary Air Station, Brown Field, Chula Vista.

$29,250—National Lead Co., Research Laboratories, Brooklyn, N.Y. for dihydroxy benzoate.

ARMY

Leronca Manufacturing Corp., Middletown, Ohio, for production of the *Pogo-Hi II* E3C target missile system for the White Sands Missile Range, N.M. Amount not disclosed.

$10,668,034—Morrison-Knudsen Co., Inc., F. E. Young Co., Johnson, Drake & Piper, Inc., Olson Construction Co. for construction of WS-107A-2 technical facilities, Lowry Air Force Base, Denver.

$20,384,003—Western Electric Co., New York for *Nike-Hercules* repair parts. (two contracts).

$13,266,720—California Institute of Technology, Pasadena, for research and development. (four contracts).

$11,900,165—Thiokol Chemical Corp. for production of rocket motors and plant maintenance at Longhorn Ordnance Works, Marshall, Texas.

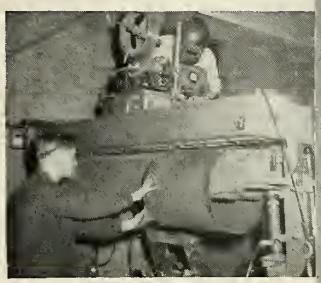
$8,000,000—Westinghouse Electric Corp. for advanced shipboard radar systems.

$7,623,416—Chrysler Corp., Detroit, for repair parts and tools for the *Redstone* missile program.

$2,153,375—Sylvania Electronics Corp., Needham, Mass., for electronic equipment.

$1,851,000—Davidson Construction Co., Inc., Manchester, N.H. for construction of tracking and data acquisition station at New Boston.

$1,190,767—Douglas Aircraft Co., Inc. for missile launching items.



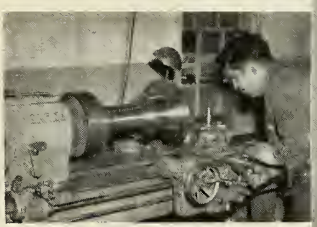
$889,000—Charles Ramsey & Co. for *Nike-Zeus* LAR receiving building, White Sands, N.M.

$581,654—Northrop Corp. for target missile research and development.

MISSILE HARDWARE by NEWBROOK

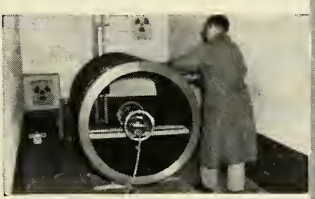
Specializing in

- MOTOR CASES
  Solid and Liquid Propellants
- JATO CASES
- NOZZLES
- PLENUM CHAMBERS
- BLAST TUBES
- FUEL INJECTORS



Finest Welding Facilities
Certified Welders

We have the "KNOW-HOW"



We have developed new techniques, new methods, new processes that effect production economy so necessary to a successful missile program.

Here at Newbrook you will find men with experience gained from doing... a modern plant with up-to-date equipment... precision inspection to meet your most exacting quality control requirements.

And most important, Newbrook specialization results in strict reliability! Let us help you with your Missile Hardware problems.

R/M PYROTEX® REINFORCED PLASTICS ... DEVELOPED TO ENDURE THE FIERY REALM OF THE ROCKET

Light, strong, heat resistant . . . for low-cost, precision fabricated rocket parts— both structural and aerodynamic

Good insulating properties make R/M Pyrotex an excellent material for rocket throats, aft insulators, and groin seat rings. Pyrotex can be molded or laminated into a wide variety of shapes.

Looking for a material that will withstand the elevated temperatures generated by missiles and rockets—internally from burning propellants, externally from aerodynamic heating? Must this material have good insulation and thermal properties, chemical and water resistance, and take a smooth finish? If so, one of R/M's family of Pyrotex reinforced plastics may be the solution to your problem.

The many outstanding thermal and structural features of R/M Pyrotex have led to its use on almost every U.S. missile. It has been fabricated into parts such as nose cones, fins, igniter tubes, rocket throats and sliver traps. Its exceptionally good dimensional stability makes possible mass production to precision standards. And it is low in cost. Write for additional information.

. . . contract awards

$514,845—**Western Electric Co., N.Y.** for *Nike* spare parts and components. (seven contracts)

$406,000—**Poorvu Construction Co., Inc.,** Wellesley Hills, Mass. for construction of Boston CONAD facilities, Fort Heath and Fort Banks.

$400,000—**Telemeter Magnetics, Inc.,** Los Angeles for development of high speed computer drums.

$310,204—**Rheem Manufacturing Co.,** Downey, Calif. for classified material.

$247,743—**J. I. Lark Construction Co.** for construction of drone target facilities at Tyndall Air Force Base, Fla.

$234,403—**Electronic Engineering Co.** of California, Santa Ana for ballistic camera synchronization system.

$200,415—**Rheem Manufacturing Co.,** Downey, Calif. for warhead fuzing system.

$206,578—**Western Electric Co., Inc.** for *Nike* spare parts and components. (four contracts)

$187,483—**North American Aviation, Inc.,** Autonetics Div. for computers.

$169,512—**Telecomputing Corp.,** Data Instrument Div. for research and development of a fixed camera reader.

$104,610—**Gilfillan Brothers, Inc.,** Los Angeles for *Corporal* missile repair parts.

$100,000—**California Institute of Technology,** Pasadena, for research and development work at the Jet Propulsion Laboratory, Pasadena.

$78,000—**North American Aviation** for design and development.

$70,000—**Maurice H. Connell & Associates, Inc.** for architect-engineer services with criteria for IRBM launch complex at Island "J."

$63,413—**Douglas Aircraft Co., Inc.** for *Blue Streak* and emergency spare parts. (three contracts)

$57,750—**North American Aviation, Inc.** Canoga Park. Classified.

$52,699—**Norris-Thermador Corporation,** Vernon, Calif. for rocket parts.

$46,651—**Hufford Corporation,** El Segundo for research and development.

$46,651—**Librascope, Inc.,** Glendale, Calif. for a tape cartridge memory system.

$45,957—**Telemetering Corp.** of America for telemetry system.

$45,000—**The Firestone Tire & Rubber Co.,** Los Angeles for modification of guided missiles.

$43,492—**A. P. Wyman, Inc.** for construction of water supply for missile facility, Bangor, Me.

$31,200—**Firestone Tire & Rubber Co.** for repair of guided missiles.

$30,000—**University of Utah,** Salt Lake City Utah for research and development.

AIR FORCE

$18,715,141—**Philco Corp.,** for extension modifications of AF AIRCOM technical control intersite and multiplex point to point facilities, including spares, special test equipment and data.

$17,000,000—**General Electric Co.** for production of high-power search radar.

$11,408,009—**I.T.T. Federal Division,** Clifton N.J. for transmitting sets, electric guidance signals.

$1,155,480—**Union Carbide Corp.,** Linde Co Div., N.Y. for liquid oxygen and semi trailers.

$923,200—**Lewyt Manufacturing Corp.,** Lon Island, N.Y. for coordinate data.

$598,360—**Cook Electric Co.,** Chicago for design, construction and test of a positiv ion accelerator.

$250,000—**National Co., Inc.,** Malden, Mass Frequency standard, missile borne wit synthesizer to be employed for missil application used in service test program

$130,000—**AVCO Manufacturing Corp.,** Cros ley Div., Cincinnati for radio receivin sets and modulators for missiles.

$112,686—**Melpar, Inc.,** Falls Church, Va. fo design, development and construction o a voice data processing system.

$100,960—**Eitel-McCullough Inc.,** San Carlo for tubes.

propulsion engineering

Propulsion by upper atmosphere chemicals is impractical for most purposes, and impossible for all but low-speed craft, a UCLA engineering professor contends. A. F. Charwat, who is also consultant to Aeronutronic Systems, says the performance of an engine operating on recombination of atomic oxygen in the so-called chemosphere (about 50 miles up) would be a function of the flight Mach number. Some people have suggested that when our knowledge of the chemosphere increases this condition may be changed, but Charwat says the speculations are not justified.

Chemospheric propulsion depends on the established kinetics of the oxygen recombination reaction. Looking at the reaction, as Charwat does in the American Rocket Society Journal, shows that an oxygen recombination engine would be operable over only a very limited range—in the "low supersonic flight Mach numbers; flight at near orbital speeds is proved not to be possible." Even in this limited range, Charwat says, the engine's performance will be marginal. He says nobody has completely disproved such an engine's usefulness or feasibility, but he doubts that a successful one can be built.

New catalysts will have to be found if an upper atmosphere engine is to be built even for marginal operation, Charwat says. The oxygen recombination reaction, although capable of releasing large amounts of energy, does not proceed satisfactorily under natural conditions. Although catalysts cannot shift the reaction equilibrium, they can accelerate reaction time. However, thermodynamically, even at a near-ideal reaction rate, there is no net thrust except in the low supersonic range. This means operation below Mach 4, with an optimum operating speed of about Mach 2.

Only very large and extremely light oxygen recombination ramjets can sustain flight at all, and then the payload is practically nothing, further Charwat calculations show. The practical problems of launching the engine and then boosting it to operational speed—besides the job of "unfolding" the engine at 50 miles—will be tough to solve. Charwat says popular statements that such an engine will be ready to fly in about two years "appear to be somewhat premature."

Linde's new super insulation (Propulsion Engineering, April 6) makes possible unvented liquid hydrogen storage tanks with a loss rate of only 9% per year, not 0.9% as mentioned. There apparently is some mix-up in the nomenclature for the insulations and super insulations. Linde reports the "super insulation" which will make lowloss liquid hydrogen storage possible is SI-4, not an offshoot resulting from the work done in developing that insulation. The April 1 article referred to the new insulation as a "powder," but the company will not confirm whether it is or is not a powder.

Hard-boiled eggs show why accelerated aging of propellants at elevated temperatures is not a true test of how a propellant responds to nonrefrigerated storage for long periods. Carl Boyars, head of the chemical physics division, Naval Propellant Plant, Indian Head, Md., says BuOrd uses accelerated cycling aging—even though there are many valid criticisms—because some short-term testing procedure has to be available to supplement long-term testing. Look at the egg, he says, and you'll see why the results of rapid aging by elevated temperatures are not necessarily valid. A chicken egg aged for just a few minutes at a little above 200°F becomes hard-boiled. However, that same egg, aged naturally at a more moderate temperature, might have produced a baby chick!

Accelerated aging, however, is a necessity in order to forecast—even with narrow limitations—the probable future behavior of a rocket. The test has its value: Certain phenomena have been spotted prior to increases in malfunction frequency. The accelerated aging program, Boyars says, also can bring to light, more rapidly than can be done by normal storage, unforeseen chemical changes.

A Message to Executives Seeking a New Plant Site

Check these 3 Important Plant Location Advantages in

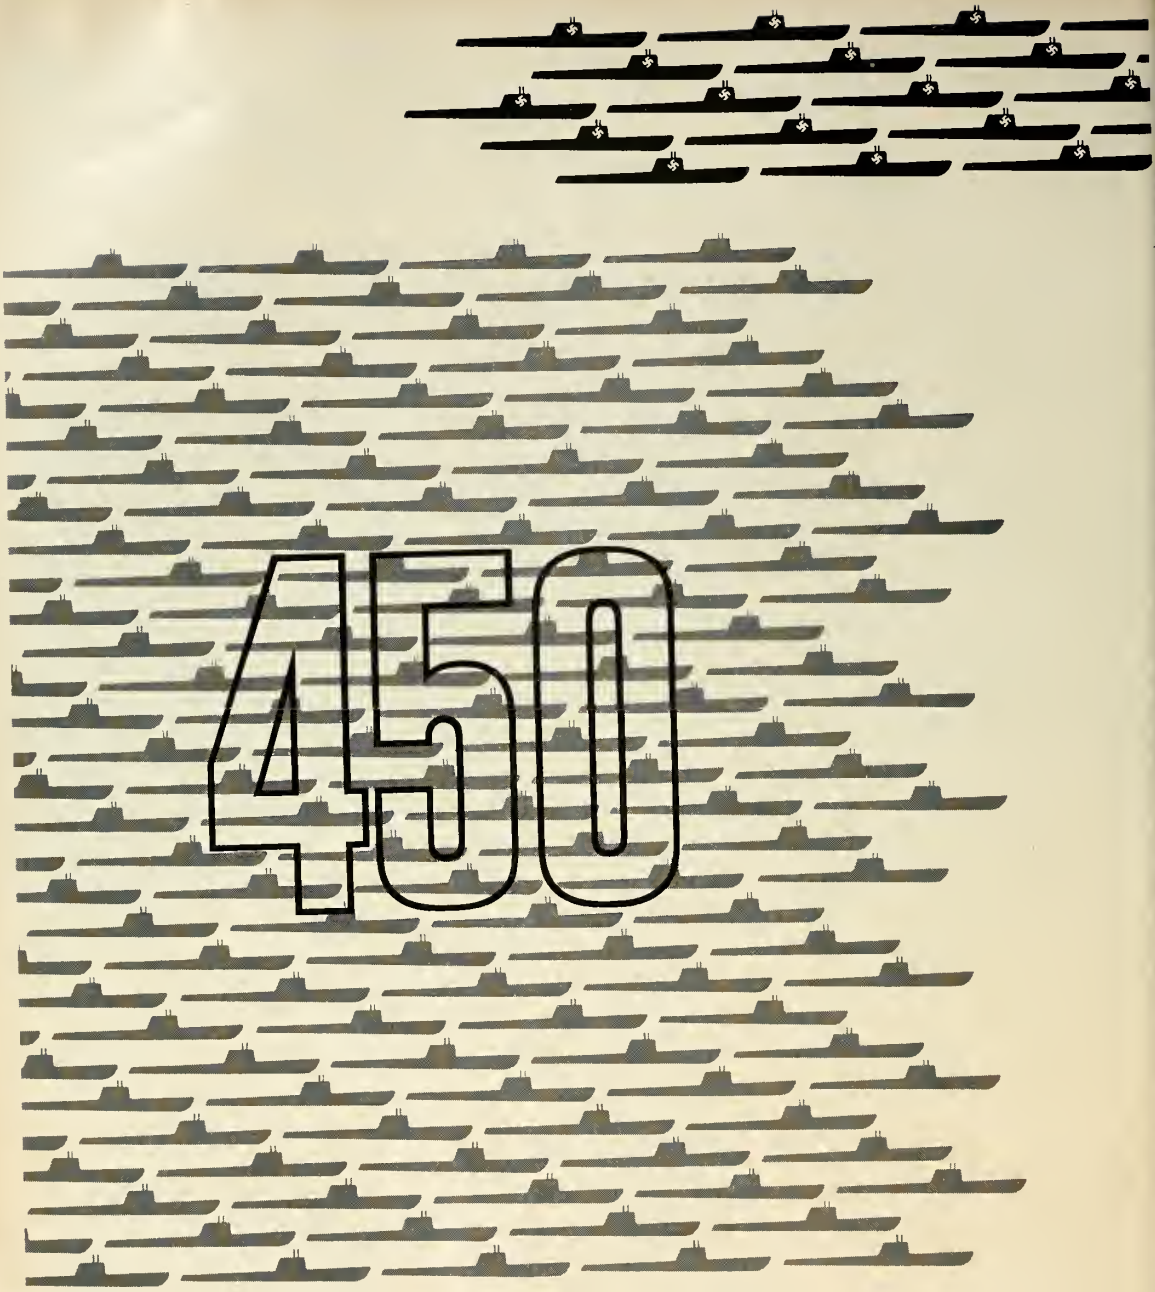
PENNSYLVANIA

100% financing for your new plant

Complete financing on lease-purchase plan—low interest rate—deferred amortization. Plant "shells" now being readied for completion. Inspection welcomed.

Improved "tax climate"

No capital stock and franchise taxes—no machinery and equipment taxes—no stock transfer tax—no state personal income tax—reduced manufacturer's sales tax.



Plant location services

Staff specialists available to serve industry, engineering firms, management consultants, industrial realtors and others with fully detailed plant location data.

EIGHT TIMES GREATER THAN THE U-BOAT THREAT

Fifty-seven submarines came close to strangling world commerce and knocking the Allies out of World War II. This was Hitler's U-boat strength at the start of the war. Today it's the sobering fact behind estimates of what 450 subs might do. For this is the threat the U. S. now faces. Today's sub is far more powerful than before . . . a more deadly menace to American overseas commerce, 99.85% of which still come and goes by ship. And today there's the additional menace o sub-launched nuclear missiles, which open our inland citie to possible devastation. If the Free World is to survive, th submarine threat must be solved. Primary fighters in thi urgent contest are the men and ships of the Navy.

ADVANCED WEAPONS | ASTRONAUTICS | ASW | ELECTRONICS | MISSILES AIRCRAFT | G | RANGE SYSTEMS

CHANCE VOUGHT DALLAS, TEXAS

VOUGHT KNOWS THIS ENEMY!

Ten years' close association with submariners, submarines and sub-launched missiles gives Chance Vought comprehensive and unique knowledge in the fight against enemy submarines.

Chance Vought has pooled this experience in a special engineer-scientist task force. Today, these men are working with the Navy and its Fleet units in critical antisubmarine areas.

For the Office of Naval Research, Vought's task force is studying advanced devices in the general field of submarine detection. For the Navy Bureau of Aeronautics, the company is exploring new means of protecting forces at sea from attack by submarines.

Vought's antisub specialists are analyzing the whole problem. Solutions will require improved devices and methods for detecting and classifying undersea craft. Development of new aircraft, missiles, and control methods is under intensive study.

In whatever direction these studies lead, Vought's antisubmarine warfare task force has the specialists and experience to analyze, design, and produce.

Antisubmarine warfare is just one in the broad spectrum of Chance Vought fields of activity. Other areas include: design and production of high performance aircraft, astronautics, electronics, advanced weapons, range systems management, commercial process control systems.

DALLAS, TEXAS

missile business

by William E. Howard

Dollarwise, what's the future of the space market? In 1965 will the United States be spending closer to $10 million or $10 billion on space missions? How important is a manned expedition to the moon? Will the day come when a probe to Mars is scratched in favor of an irrigation project in the Sahara?

An evaluation of the broad problems ahead of industry and the nation has been made by E. B. Doll, vice president of Space Technology Laboratories. His conclusion, in brief: right now we are long on technical know-how, but too short on basic wisdom.

"The technical developments in this field have come so rapidly, and pose such complex questions," say Doll, "that there has not been time for the general public, our national leadership, or even our scientific community to evolve a sufficiently deep and broad-based set of values, principles and objectives concerning space projects to permit these projects to be viewed in proper perspective."

Moreover, Doll contends, "as a nation, we are not yet prepared philosophically to judge the importance of space technology as compared with other segments of science and engineering. There is no reservoir of common understanding of the military or economic or scientific values of accomplishing space missions. There is no general agreement on which particular projects will contribute the most to our military strength and national security, to scientific progress, or to the preservation of individual liberty and health and happiness."

Foresight being a hard-to-come-by commodity anytime, Doll proposes that in view of the nation's "limited" economic and intellectual resources, much concentration should be given to distinguishing between what is possible—and what is needed; what can be done—and what should be done.

What is the immediate space market outlook? Doll, whose firm is a chief consultant to the Air Force BMD, sees space missions bound closely "for many years to come" to military requirements and, chiefly, ICBM development. "It is unlikely that the development of manned stations on the moon or like projects will be pursued in the foreseeable future under the forced draft of military necessity," he says. Emphasis will be on improving ICBM's, advanced aircraft systems or other advanced, but earth-tied, military projects.

Does this mean that space missions are out? Not necessarily. But, here is where the question comes in of determining what should be done. Doll notes that there are commercial as well as military applications for communications satellites, intercontinental rocket flight, and possibly, control of the earth's weather from a satellite system. With global television, he concedes there may be problems. "Nevertheless, I suspect that an international public which has learned to withstand the pressures of TV commercials would be less likely to succumb to misleading political propaganda."

Money spent now on instrumented and manned space probes, Doll feels, must be weighed against earthly requirements, such as the conquest of cancer. But he thinks that perhaps in 50 years the economy may expand to where paying $1 billion for a "synthetic planet-type" space vehicle holding several thousand people would be a "trivial" expenditure.

However, Doll says "major new scientific discoveries" are needed first before manned flights to Mars and Venus and creation of a manned lunar station become possible. This requires extensive research. Therefore, he says, "advanced research and development activity is a most important future space market."

Another important requirement: there must be widespread public understanding of basic technical and non-technical facts associated with both missiles and space programs. The reason, says Doll, so U.S. citizens may "properly arrive at some of the difficult national decisions which lie ahead of us."

CAN YOU USE a STEEL FABRICATING PLANT in LOS ANGELES AREA ?

Unique opportunity to acquire all or part of this old established company. Facilities for all code work. Experienced employees. Owner can lease, sell, or accept stock. Brokers invited.

Unusual career opportunities for qualified scientists and engineers . . . write Avco/Crosley today.

Avco / Crosley

From Crosley . . .

Command Receivers for Drones and Missiles

Designed and manufactured by Avco's Crosley Division, Command Receivers are standard equipment aboard most of the nation's missiles. Their job: To receive and act upon instructions from the ground to destroy the missile when its flight path indicates the missile has gone awry.

In a missile configuration, the Command Receiver weighs only 12 pounds, has three channels and incorporates a decoder and power supply in a simple pressurized package.

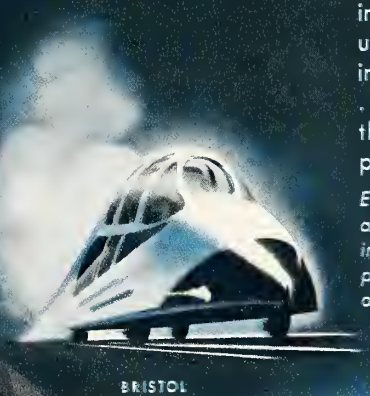
A second version of the Command Receiver, employing 12 channels for radio communication, is used in high-performance drones and decoys. In such applications, the Command Receiver actuates control surfaces, directs engine operation and opens the recovery parachute—all by radio-conveyed instructions from the ground.

A Product of Crosley Engineering, the Command Receiver has proven itself for the future by the job it is doing in the missiles and drones of today.

For more information, write to: Vice-President, Marketing-Defense Products, Dept. M-59, Crosley Division, Avco Corporation, 1329 Arlington Street, Cincinnati 25, Ohio.

Weighing only 12 pounds, Crosley Command Receivers direct destruction of off-course missiles, control drone recovery.

THIS IS THIOKOL...



serving industry and the national defense

In modern plants strategically situated throughout the country, Thiokol is making many significant contributions to the art and science of rocketry.

By developing new and better propellants (both solid and liquid)—by designing and building improved power plants to utilize these fuels—by furnishing essential support equipment . . . Thiokol helps to strengthen the nation's defenses, helps push back our spatial frontiers.

Engineers, Scientists: perhaps there's a place for you in Thiokol's expanding organization. Our new projects present challenging problems and a chance for greater responsibility.

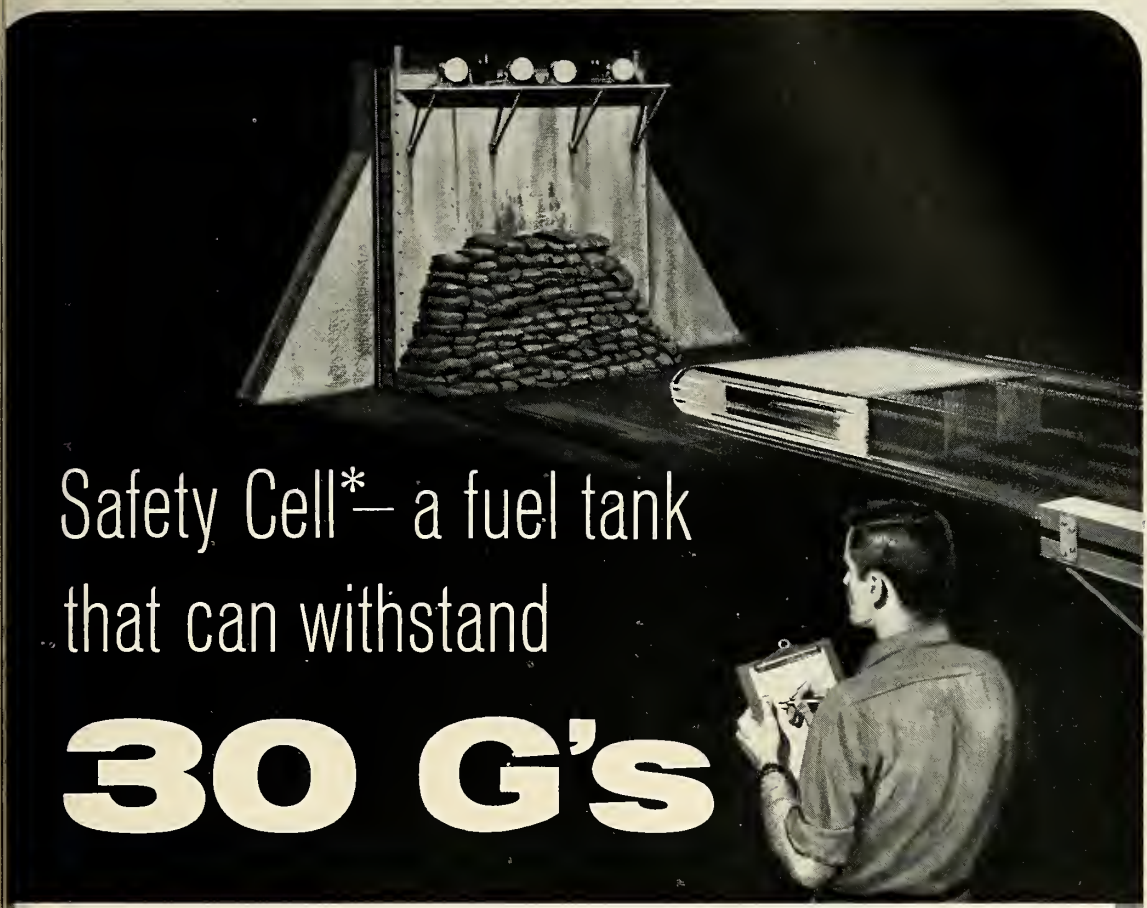
VOLUME PRODUCTION

HYDRAULIC SERVO VALVES WITH HIGH RESISTANCE TO CONTAMINATION

This is the Bendix-Pacific Electro-Hydraulic Servo Valve with the shrouded nozzles. It offers the advantages of both a dry coil and a wet coil valve by isolating the torque motor from circulating flow. There is no sacrifice in performance normally associated with dry coil sealing devices.



The Bendix-Pacific shrouded nozzles are parallel to each other. This provides a torque motor with two air gaps, doubling available torque. As the armature does not operate about a fixed point three advantages result: (1) Larger flow passages that are less susceptible to contaminants. (2) Higher response is achieved by faster exhausting of spool and pressure chambers and (3) Nozzle back pressure is sustained with reduced supply pressure thereby maintaining stiffness and null stability.

These Bendix-Pacific Servo Valves are in volume production. Application engineers are available to discuss system problems and adaptation of these valves to your specific needs.

Safety Cell*— a fuel tank that can withstand 30 G's

THE PROBLEM: how to control aviation fuel during high-impact conditions so that instantaneous vaporized combustion can be prevented.

THE GOODYEAR ANSWER: Safety Cell, a high-strength, low-weight fuel tank made of super-tough rubberized fabric. Under exhaustive testing, in cooperation with the Federal Aviation Agency, these tanks have successfully withstood impacts exceeding 30 G's—maximum level of human tolerance. This means that the danger of vaporized combustion at impact is substantially reduced. Thus, the opportunity for survival is materially increased. A number of these tanks are already in use.

THE SIGNIFICANCE: personnel and property protection against full vapor combustion far beyond any type previously obtainable.

More information on Safety Cell, the revolutionary new fuel cell, is yours for the asking. Simply write Goodyear, Aviation Products Division, Akron 16, Ohio.

CEC pickups measure airfoil pressures to 5000 psi ...at 600°F.

Testing the hot ones is easy for rugged CEC Pressure Pickups...the 4-316A and 4-317, both designed for a wide range of pressure measurements at extremely high temperatures. Hundreds of these unique pickups were used to measure the dynamic and static pressure differential on airfoil surfaces of the Convair B-58 during the testing program for the nation's first supersonic bomber.

Designed for continuous operation at 600°F. without cooling, the 4-316A and 4-317 cover a pressure measurement range of 15 to 5000 psi gage. Among their features: one-piece construction machined from 416 stainless steel... 5/8" and 1/2" normal diameters... weights of 55 and 23 grams with mounting flanges. They are widely used in flightload testing, engine studies and supersonic tests. Where external cooling is practical, an adapter extends the operating range of the 4-317 to 2000°F.

For additional information, call your nearest CEC sales and service office or write for Bulletins CEC 1568-X36 and 1588-X10.

expandable for growing needs:

a full range of Burroughs electronic computers

for science and business

From advanced computer systems to individual computer components... the Burroughs line of electronic data processing equipment spans a full range of varied requirements for both scientific and business applications. • Start at the top if your needs call for giant computer ability: The *Burroughs 220,* first and only available medium-priced computer with expandable magnetic core storage... a powerful multi-purpose system which can grow with your computational requirements. The *220* is now at work and delivering effective results at the lowest application cost. • If present application demands are more moderate, investigate the versatile *Burroughs 205.* First in its field with external magnetic tape storage... complete choice of input/output media with flexible, modular expansion, top capacity and speed. The *205* has thoroughly proven its economic value in a wide variety of scientific and business applications. • Most popular of all low-cost computers is the *Burroughs E101.* Exclusive, simple pinboard programming frees engineering man hours, by reducing manual computation time up to 95%. Machine ability is further extended by optional punched paper tape input/output equipment and new punched card input unit. • Burroughs advanced sub-systems include: *Datafile* magnetic tape unit with vast external storage capacity... up to 50-million digits per unit; *Cardatron*...fastest, most powerful card handling system; *220 High Speed Printer System* ...a transistorized unit with unmatched speeds up to 1500 lines per minute, on-line or off-line operation. *High Speed Photoreaders, Magnetic Tape Units* and other computer system components are also finding wide use in data processing, communications and allied fields. • Currently in production, all these Burroughs products are designed to meet your growing data processing needs... and supporting the entire Burroughs line is an outstanding team of computer specialists for efficient, on-the-spot, technical assistance. Write today for brochure, specifying system or component. • ElectroData Division, Pasadena, California.

The Next Deputy Defense Secretary

It would be difficult to over-estimate the importance of choosing wisely the man who will succeed Donald A. Quarles as Deputy Secretary of the Department of Defense. He must be selected with an eye to his scientific background, for his managerial effectiveness, for his familiarity with the Defense Department and its thousands of complexities—and for the problem of maintaining a continuity of experience in this top defense post.

It is difficult to think of a man whose presence in the Pentagon will be more greatly missed than Donald Quarles, who died in his sleep a few days ago, as quietly as he had lived. It would also be difficult to find a man who brought to the job a greater combination of attributes needed to fill it and a greater devotion to duty. Don Quarles literally gave his life for his country. A few weeks ago he was urged to take a vacation. He replied that he hadn't the time. Doctors discovered after his death that the cause of it could have been averted by a little rest and a little relaxation of the tensions he unavoidably built up through the overlong hours and concentration he continually practiced.

Two Secretaries of Defense, Charles Wilson and Neil McElroy, leaned heavily on Don Quarles for guidance, especially in the military scientific field which broadened immeasurably after *Sputnik*. Many of the decisions which brought about our present military and space posture were, whether you like them or not, directly attributable to Mr. Quarles.

Lacking in scientific knowledge himself, Secretary McElroy must now find a man for his deputy who will adjudicate the split personality in the Defense Department which he, himself, has created; the three-headed organization of military space development—Directorate of Science and Engineering, Advanced Research Projects Agency and Special Assistant for Guided Missiles.

The man who helps Secretary McElroy with those decisions must also be prepared to step into the top job should the Secretary adhere to his original determination to return to his corporation position in late summer or autumn. The appointee must be prepared to name his own deputy and to remain on until the new administration. The greatest of all dangers to the country and its military program could be a lack of continuity in the office.

There have been a number of names suggested as a successor for Mr. Quarles and they cover a wide field—Henry Cabot Lodge Jr., the U.S. United Nations representative; Gen. Alfred M. Gruenther, former SHAPE commander and present head of the American Red Cross; Wilfred J. McNeil, assistant secretary and comptroller of the Department of Defense; and William C. Foster, present executive vice president of Olin Mathieson Chemical Corporation.

Also possibly under consideration are Richard Horner, Assistant Secretary of Air Force for Research and Development, and Thomas J. Gates, Jr., Secretary of the Navy. Chiefly against the latter two is the fact that each is identified with one of the services and would draw immediate opposition from the others. Also, Mr. Horner has accepted a new post as general manager of NASA which he will assume on June 1 and which would complicate his acceptance.

On the others: Mr. Lodge, however brilliant otherwise, would be thrown into an unfamiliar field for which he is little prepared. He served in the Army during World War II and was President Eisenhower's campaign manager in 1952. Mr. McNeil is a career Pentagonist and certainly is familiar with all its operations, although his experience has been strictly financial and he would not be a popular choice with the services, where there is a feeling that he sometimes over-controls with the purse strings.

The appointment of Gen. Gruenther would require the passage of a special law because the act creating the office of Secretary of Defense specifies that it must be held by a civilian.

While not the most prominently mentioned, William Foster is possibly the most logical and the best qualified of the men whose names have been suggested. Actually, he was also under consideration for Mr. McElroy's position—if he left in the Autumn and if Mr. Quarles had not been named.

Bill Foster has held a variety of high level government jobs including Under Secretary of Commerce, Deputy Administrator of ECA and Deputy U.S. Special Representative in Europe, a NATO post.

And—he was Deputy Secretary of Defense from September, 1951 to January, 1953, serving under Republican Secretary Robert Lovitt during a Democratic Administration. He was educated at M.I.T. and, importantly, has never been very far away from OSD and its operations since leaving his position there.

As a member of the Gaither Committee, he is credited largely with writing the report of a year ago which recommended sweeping changes and reorganizations in OSD, many of which have been put into effect.

We have no idea who will be selected for the post, but we do feel strongly that the importance of choosing the right man is of vital consequence to the country. Selecting anyone but the best available man would be a great tragedy for it is one of the most important jobs in the world today.

Clarke Newlon

What are your missile fluid line design problems?

When you have problems in the fabrication and design of tube components involving critical tolerances for any missile, power plant and ground handling applications call STRATOFLEX.

For example, two special aluminum elbow tubing assemblies (shown below) were designed to convey liquid oxygen in missile power plants. These assemblies were designed and manufactured to rigid specifications. Made from 4.500 O.D. x .125 wall tube and machined flanges, dimensions between sealing surfaces (up to 16 inches) were held to tolerances of ± .010 on linear and ± 1/2 degree on angular dimensions.

Other design problems are being solved daily by Stratoflex Engineering. Allow your Stratoflex Representative to acquaint you with these specialized services.

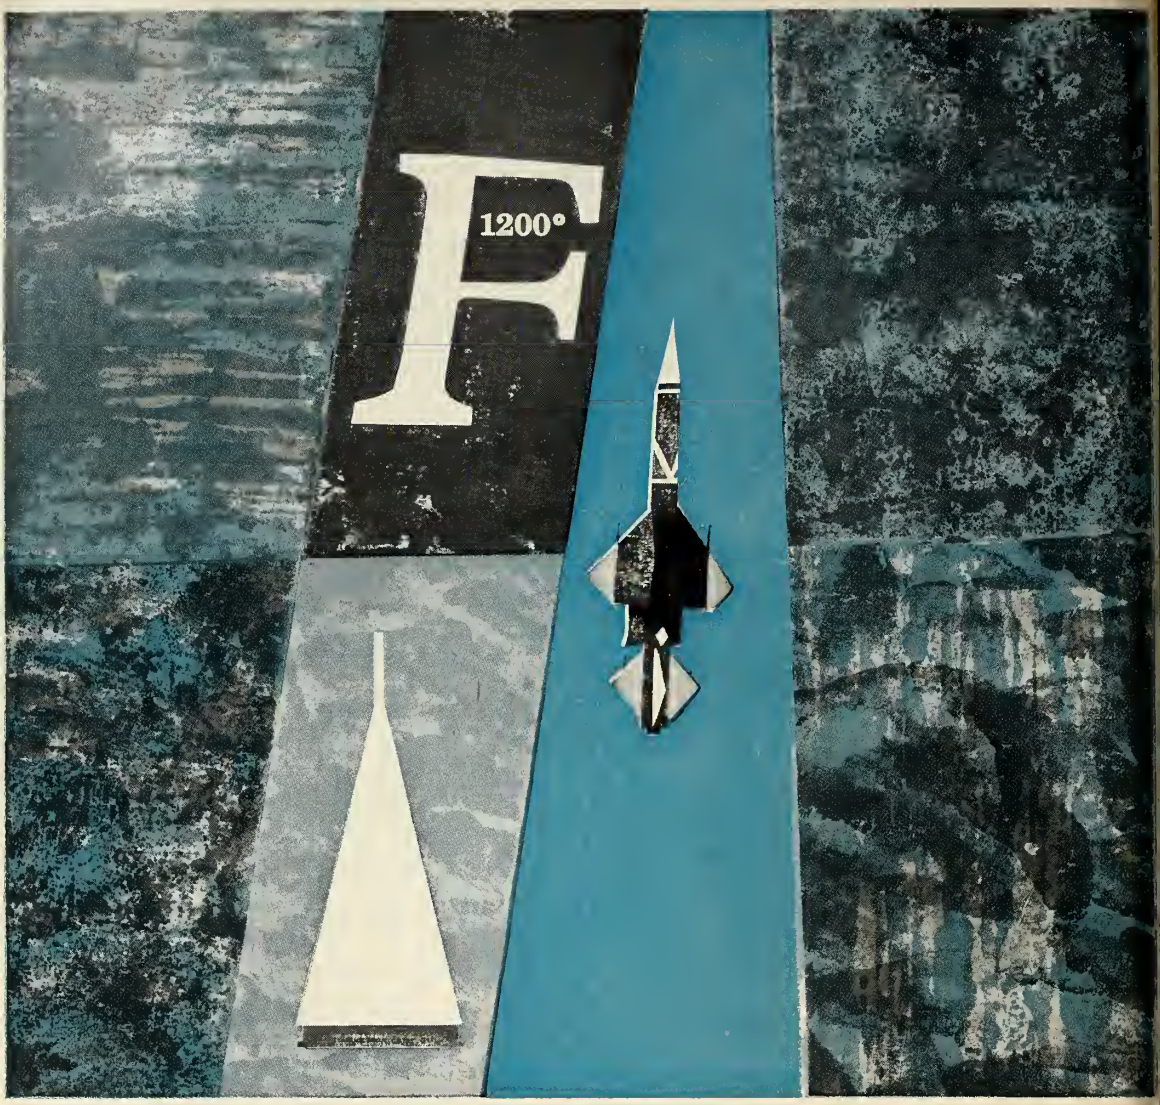
TEPS IN THE RACE TO OUTER SPACE

Nuclear Rocketship



spite the sky-high transportation costs, nar manufacturing should prove eco- mically viable. With unlimited Solar wer, controlled atmospheres and ad- nced automation, a considerable com- erce could be realized in delicate in- uments, rare minerals, reactor cores d other items that might be more ef- iently processed or produced in the on's perfect vacuum.

To supply the Moon colonists, and to rry their production back to Earth, ecial rocketships will be developed. Nuclear energy is the most promising source of propellant power. The ship shown here utilizes nuclear fission for heat and hydrogen gas as a working fuel. From pressurized tanks, the gas is fed through a heat exchanger, expanded, and expelled for the motive thrust.

When the craft leaves Earth, it carries only enough gas for a one-way trip. For, by extracting hydrogen and oxygen from Lunar rocks, Moon settlers will be able to refuel the rocketship for the return voyage. This will permit smaller fuel tanks on the craft and larger payloads.

Inertial navigation systems will play an increasing role in the exploration of outer space. ***ARMA*** is actively supporting the Air Force's program in long range missiles and is in the vanguard of the race to outer space. ***ARMA***, Garden City, N. Y. A Division of American Bosch Arma Corp.

AMERICAN BOSCH ARMA CORPORATION

BRUNSWICK "SHOOTS" THE RADOME RANGE TO 1200° F

Brunswick makes a new breach in the thermal barrier with newly developed non-metallic materials that boost the temperature tolerance of radomes and nose cones to 1000-1200°F for limited exposure periods – almost twice the previous limit. This new advance in Brunswick's Strickland 'B' Process of filament winding opens a new chapter in aircraft and missile designing.

New "SBP" filament winding results in the highest strength-to-weight ratios ever obtained in radomes and nose cones with significant weight savings over conventional structures. With unmatched electrical uniformity, Brunswick builds them to meet the tightest tolerances for dielectric constants and compound configurations. Brunswick offers full electronic testing facilities.

Brunswick radomes and nose cones now slice skyward on such supersonic aircraft as the advanced Convair F-106; on such missiles as the Boeing Bomarc and Lockheed Q5. For details on Brunswick's leadership in research, development and testing, write: The Brunswick-Balke-Collender Company, Defense Products Division, 1700 Messler St., Muskegon, Mich.

washington countdown

IN THE PENTAGON

The Pentagon has cut the number of IRBM squadrons for NATO to eight—five Douglas *Thor* and three Chrysler *Jupiter*. Four 15-*Thor* squadrons go to Britain; probably all three 15-*Jupiter* squadrons go to Italy. That leaves only one *Thor* squadron for Turkey.

• • •

The secret Goodyear *Pinpoint* guidance system now under development will be used in ballistic missiles in conjunction with inertial guidance. *Pinpoint*—successor to topographical map-reading *Atran*—apparently will be used to direct the missile to its target with greatly improved accuracy during the terminal phase of flight.

• • •

The Navy expects to extend the range of Lockheed's *Polaris* considerably beyond 1500 nautical miles during the next four or five years. However, it says the first *Polarises* put into submarines next year will have a 1200-mile range. It says no modification of the submarines will be necessary as the range is extended.

• • •

The Air Force sees the Boeing *Minuteman* as a bargain weapon compared to *Atlas* and *Titan*. Cost of a *Minuteman* including its hardened site and related expenses is expected to run about $1.5 million, compared to more than $10 million for the *Atlas*.

• • •

The Navy is considering the use of inflatable rubber planes as missile-carrying drones. The planes could be flown from carriers.

• • •

Bigger megaton warheads are in the works for both the Convair *Atlas* and the Martin *Titan*. Until recently the *Atlas* has been scheduled to pack a four megaton warhead . . . the *Titan* seven.

• • •

The first of the Martin *Mace* groups being sent to USAF troops in West Germany is expected to be operational this summer. The *Matadors* that the 60-missile *Mace* groups are replacing are going to West German troops. Plans call for quickly replacing all three U.S. *Matador* groups with *Maces*.

Meantime, the *Mace*, which can be fired from mobile launchers, is about to go into hardened sites. The FY 1960 budget calls for spending $10.2 million on hardened *Mace* sites in West Germany. (M/R, May 11.)

ON CAPITOL HILL

The House Defense Appropriations Subcommittee is readying a multi-million-dollar package increase in the FY 1960 budget for ICBM's. Extra money is included for *Atlas*, *Titan* and *Minuteman*. Some say the fattened appropriations bill will reach the House floor by early next month.

• • •

But some Congressmen don't hold out much hope that the Pentagon will pay any attention to the increase even if it clears Congress. The Air Force already has proposed that the nine-squadron *Atlas* program be increased considerably—possibly doubled. However, Defense Secretary Neil H. McElroy has made clear that he is opposed to it. Probable fate of any Congressional increase at this time: The money will be impounded.

AT NASA

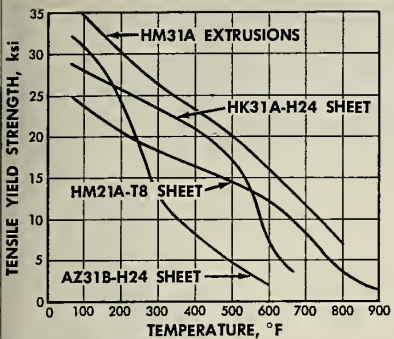
A new NASA attempt to take over the Army's Redstone Arsenal appears almost certain prior to the formulation of a supplemental FY 1960 budget or the FY 1961 budget. If the move flops again, attempts will be made to put enough money in the new budgets to give NASA a similar facility. NASA officials have no complaints with the Army's cooperation at Redstone. But they feel that the space agency will need all of Redstone's in-house capability to design and integrate the newer space systems.

AROUND TOWN

The United States is planning to cooperate fully with Britain on its plans to develop a space exploration program of its own. Look for possible joint projects of increasing magnitude. So far the British are planning to turn out instruments for satellites and adapt some of their missiles for possible launchings.

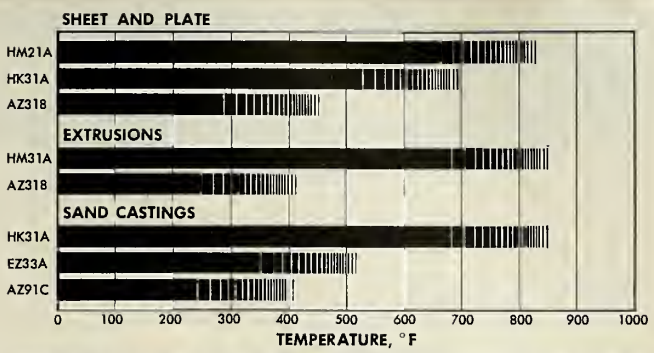
DOW | MAGNESIUM

a comparison:



4 MAGNESIUM ALLOYS for elevated temperature service

A wide variety of elevated temperature alloys extends the use of lightweight magnesium into the critical 300°-800°F. temperature range.



Name your weapon—Jupiter C, Polaris, Talos, Discoverer, Falcon or Bomarc. All make extensive use of elevated temperature magnesium alloys. Improved resistance to creep, increased stiffness and strength and exceptional shop characteristics are the long suit of these materials. At elevated temperatures they maintain a high ratio of fatigue strength to static strength. (About the same ratio as standard magnesium alloys at room temperature.)

SHEET AND PLATE

Alloys HK31A and HM21A have been widely used for many different parts in missiles, rockets and aircraft. Some of the most common applications include body skins, engine air inlets and ducts, nose cowlings and cones, external and internal skins on control surfaces. HK31A extends the usefulness of light-

New alloys have extended magnesium's useful service temperature range.

A comparison of short-time tensile yield strength exhibited by a standard magnesium alloy and the commonly used elevated temperature alloys.

weight magnesium to a temperature of 500°F. and above. HM21A withstands temperatures up to 700°F. and higher for short time periods. And it exhibits better creep resistance above 350°F. and better static properties above 550°F., than does HK31A.

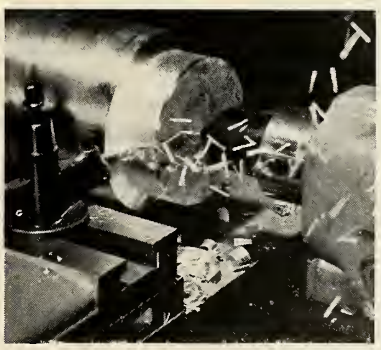
FORGINGS

At operating temperatures up to 800°F., HM21A offers excellent mechanical properties, optimum creep resistance. HK31A has better room and elevated temperature properties up to 400°F. Both have good forgeability.

CASTINGS

Engine air inlets and ducts and housings for electronic guidance systems are examples of the many applications of cast magnesium alloys HK31A and EZ33A. EZ33A has good general properties in the 350°-500°F. range. HK31A is recommended up to 700°F. and above. Components of military systems weighing as much as 105 lbs. have been cast in one piece with HK31A. A new elevated temperature alloy for die casting is now in development and will soon be available.

EXTRUSIONS



Alloy HM31A has put the many benefits of elevated temperature magnesium into extrusion form. This alloy is used as ribs and stiffeners in missile bodies, instrumentation booms and external tunnel fairings for wiring and plumbing, etc. HM31A maintains high elastic modulus, excellent creep resistance and strength at elevated temperatures. Elevated temperature exposure at 600°F. for 1,000 hours causes no change in room temperature properties and only a slight drop in creep strength.

ELEVATED TEMPERATURE MAGNESIUM EXCELS IN PRODUCTION

The elevated temperature alloys possess the best welding characteristics of all magnesium alloys. Arc welded joints can be easily made and welding compatibility of magnesium alloys is excellent. For example, HK31A sheet can be welded to HM31A extrusions.

Weld efficiencies at room temperature range from 70% to 80%. At temperatures above 400°F., HK31A has a weld efficiency of 100%. The same goes for HM21A above 500°F. In general, preheating and stress relieving are unnecessary with these alloys. They can be readily spot welded and are not subject to cracking.

Machining operations can be carried out at extremely high speeds, with heavier depths of cut and higher rates of feed than are possible with other metals. All chemical treatments used to finish standard magnesium alloys are applicable to the elevated temperature alloys, with the exception of Dow 7, which does not coat satisfactorily on magnesium-thorium alloys. For extended service above 400°F., the anodic treatments are preferred.

Elevated temperature alloys possess the same excellent shop characteristics—such as machining, forming and welding—as the standard magnesium alloys.

Temco AIRCRAFT DALLAS

NAVAL AVIATION MAKES HISTORY
with ALL-JET TRAINING

NAVCAD Earland R. Clark of Stroudsburg, Pa., receiving congratulations from Rear Admiral Joseph M. Carson, Chief of Naval Air Basic Training.

On March 13 at the Naval Air Basic Training Center, Saufley Field, Pensacola, Florida, the first student pilot in Naval Aviation history soloed a primary jet aircraft—without previous propeller-driven aircraft experience. The flight was made in a TT-1 "Pinto" — designed specifically by Temco for all-jet training.

The first primary jet trainer ever purchased by any of the U. S. military services, the Pinto is designed for today's jet age. It is built closely along the lines of high-performance jet fighter aircraft and gives the student pilot the "feel" of jet training from the very beginning.

With its high safety standards, fine handling characteristics, optimum maintenance provisions and overall reliability, the Pinto is an ideal primary jet trainer. From initial cost to operation and maintenance, it is designed to provide better pilots at less cost, in less time. All in all, it gives the Navy a decided edge in the ever-advancing pace of military jet aviation.

STRUCTURES

Navy is complaining to Congress its 1960 FY request of $35.3 million for *Asroc* and *Subroc* is "about one-half" of what should be spent for ASW torpedoes. Both missiles are now ready for production. Over next five years, Navy plans to spend $100 million modernizing 200 ships for ASW capability, some with the Minneapolis-Honeywell *Asroc* (rocket assisted antisubmarine missile) which has replaced the *Rat* (rocket assisted torpedo.) Goodyear's *Subroc* (anti-submarine rocket missile), Navy says, will furnish submarines with "enormous kill potential."

• • •

Missile procurement is being cut back 15% by Air Force. In the 1960 FY, the AF plans to procure 1232 missiles compared to 1462 in Fiscal 1959. Figures do not include rockets and drones.

• • •

NASA contractors are now eligible for financial backing under the Defense Production Act of 1950. President Eisenhower has authorized the space agency to use the law to guarantee loans and other financial aid to insure delivery of goods or services.

• • •

Chances are good four-year extension of Renegotiation Act will pass Congress as approved by House Ways & Means Committee. Bill eases present provisions for two-year loss carry-forward to five years and provides appeal from tax court findings. Four-year extension is compromise between permanent extension demanded by House Armed Services Committee Chairman Carl Vinson and 27-month continuation sought by DOD.

PROPULSION

Look for speed-up in *Centaur* upper stage space vehicle development as a result of "breakthrough" in large-scale production and storage capability of liquid hydrogen. ARDC says "purest (liquid) hydrogen ever made" is now being turned out in quantities at Air Products plants in Painesville, Ohio, and Palm Beach and at Stearns-Roger Mfg. Co., Bakersfield, Calif. Ample supply may enable Convair *Centaur,* which has Pratt & Whitney LOX and liquid hydrogen second-stage engine, to advance production timetable now scheduled for "sometime" in 1961.

Coming up in June: second-stage flight testing of Martin's *Titan.* Largest second-stage rocket ever to be flown, the Aerojet-General propulsion system develops 80,000 pounds of thrust at altitude using LOX and RP-1 fuel. *Titan* is expected to be "approaching operational" by mid-1960.

ELECTRONICS

BMEWS and SAGE programmed construction in FY 1960 will top $124 million—with $76.3 million going into "hardened" SAGE installations to house completely transistorized computers in supercombat centers.

• • •

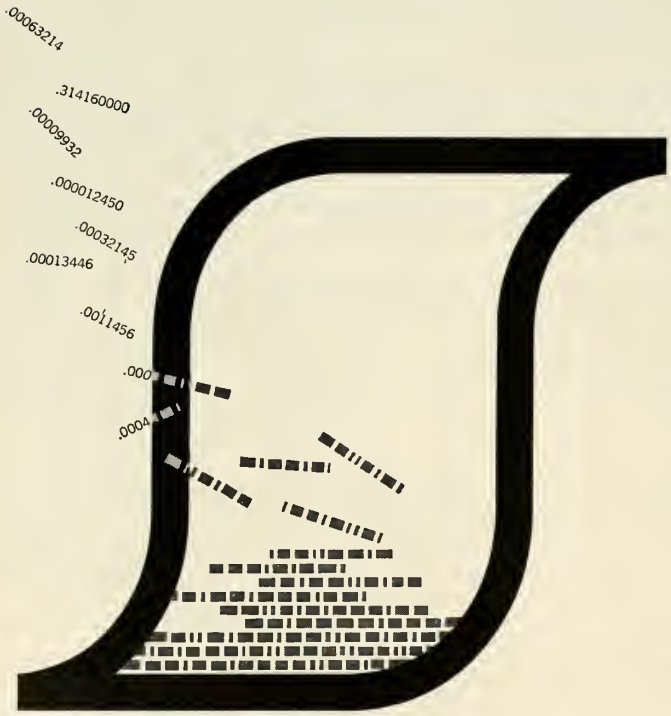
At Clear, Alaska, $18 million worth of BMEWS construction is getting underway. Principal contractors for Corps of Engineers are Morris Knudsen and Patti McDonald (surveillance radar and scanner building); Baker & Ford (antenna and transmitter building); William A. Smith (railroad relocation). A&E is by Metcalf & Eddy and Skidmore, Owings & Merrill. Bids will be opened June 10 by Alaska district engineer on a powerplant. BMEWS systems contractor is RCA.

• • •

Keeping industry's doors shut to visiting Communist technical teams is being urged by Sprague Electric Co. President Julien Sprague. With one good look, says Sprague, a competent engineer may save 10 years of research simply by learning that a particular process can be accomplished by a new technique.

• • •

Expenditure of $2 billion on missile electronics in Fiscal 1960 is forecast by EIA President David R. Hull. The weapon systems concept, adds Hull, should be continued because it enables the military to "buy competent management" and fixes responsibilty for production and integration of complicated systems.



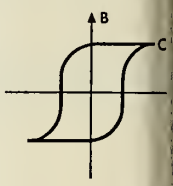
ASTROPHYSICS

Evidence is piling up that solar eruptions have a "braking" effect on the speed of earth satellites. Says Dr. W. O. Roberts of the University of Colorado: "Satellites appear to decelerate more rapidly at times of high solar activity, to experience greater drag." As yet, no explanation for this phenomenon.

More about the missile week on page 24

TAPING CRITICAL INFORMATION?

"SCOTCH" Brand high potency oxides let you pack more bits per inch!

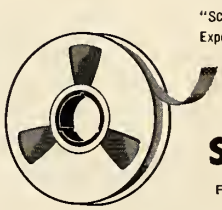


Every day SCOTCH Brand High Resolution Tap are getting the nod for more instrumentation job The reason? Performance. In taping high frequenc data, the sharper resolution lets you pack mo pulses to the inch—a greater density of inform tion to each foot of tape.

At the root of this advance are the high potenc oxides used in the magnetic coating. The high magnetic retentivity of these oxides—about a thir more than standard—offers distinct advantages. permits the use of a thinner magnetic coating whic may be combined with a thinner polyester bas Naturally, this means a more flexible tape — or that conforms for more intimate tape-to-hea contact, automatically improving resolution in th taping of high frequencies.

Even so, you don't have to sacrifice output in lo frequencies. For in addition to the marked increas in sensitivity to short wave lengths, SCOTCH Bran High Resolution Tapes show some increase in sens tivity even to long wave lengths.

These more flexible tapes cut drop-outs, to With better tape-to-head contact, there's less chance that a stray bit of dust can sneak between tape and head to cause a drop-out. The superior magnetic properties of SCOTCH Brand High Resolution Tape No. 159 show up in oscilloscope tests—producing a good squared-up hysteresis curve like that shown at the right, and symbolically illustrated at the left.



Whatever your application—data acquisitio reduction or control programming—you can cou on SCOTCH Brand technology to create tapes c higher uniformity and reliability for error-fre performance.

SCOTCH Brand High Output Tape No. 128 pr vides the sensitivity for good output in low fr quencies, even under extremes of ambient tempe ature. SCOTCH Brand Sandwich Tapes No. 188 an 189 offer extremely long life and reduced hea wear in digital work and many AM, FM and PD applications. Finally, for top performance at lo cost per foot, SCOTCH Brand Instrumentation Tape No. 108 and 109 remain the standard for th industry.

Where there's no margin for error, there's n tape like SCOTCH Brand. For more details, mail th reader inquiry card or write Magnetic Product Div., 3M Company, St. Paul 6, Minnesota.

MAGAZINE OF WORLD ASTRONAUTICS

U.S. Decides to Push ALBM—'Invulnerable' Defense Weapon

Douglas wins competition and begins design study based on concepts tested by Lockheed, Convair and Martin; GE said to have guidance contract

by James Baar

WASHINGTON—U.S. grand strategy the future of missile warfare took harp turn this month. It came with award of an Air Force contract development of America's air-ched ballistic missile—the much-ed-about ALBM.

Douglas Aircraft Co., a dark horse tender who won the contract over competitors, has six months to come with a refined design and cost study first step in its development pro-n.

The solid two-stage ALBM will be erned after the concept already ved feasible in the firing of test icles designed by a Lockheed-vair team and Martin—both losing petitors for the development tract.

General Electric Co. is reported to working on guidance and nose cone the missile. Other subcontractors expected to be announced shortly, Thiokol believed ahead for the tors contract.

The Air Force paid Martin $5 mil- and Lockheed $3.5 million for r feasibility studies. Results were red with all 15 competitors for the elopment contract. The Air Force had an ALBM study contract with Donnell.

Cost of the development contract is known. The Air Force said it ld be negotiated.

• **Program vague**—Meantime, many ails of the program were withheld. if released at all, they were left ue.

But the overall scope and meaning the program was clear. All one had to do was look at the key characteristics the ALBM was expected to have.

• It will deliver a nuclear warhead.

• It will have a range of more than 1000 miles—possibly as much as 1500.

• It will be launched from supersonic bombers flying at up to more than 70,000 feet.

• It will travel a ballistic path out of the atmosphere and back at hypersonic speeds that will make it unstoppable once it is launched.

• It will have greatly improved guidance that will give it considerably greater accuracy than is considered acceptable for missiles with much larger warheads.

In simplest terms, the ALBM is merely an advance on the North American *Hound Dog*. But the advance is tremendous.

The air-breathing *Hound Dog*—recently launched successfully from a B-52 flying over the Atlantic Missile Range—was swiftly developed from off-the-shelf components for service during the years of the Missile Gap.

Its Pratt & Whitney turbo-jet engine enables it to carry a nuclear warhead 500 miles at only about Mach 1.7. It was designed for launching from the B-52G.

• **Use on B-70**—The ALBM will be developed for launching from the B-70 designed to travel at Mach 3 and the Convair B-58 designed to fly at Mach 2. It also will be launched from the intercontinental B-52G.

The B-70, still under early development, will have true intercontinental range. The B-58, scheduled to be operational next year, can be made intercontinental with refueling in flight.

Also, the ALBM is designed to be the Sunday punch of the CAMAL—the much-delayed program aimed at placing subsonic nuclear-powered planes on station in the skies.

And, finally, the ALBM is the obvious stepping stone to development of the space-launched ballistic missile which would be fired from a manned space craft or an orbiting satellite.

• **ALBM strategy**—The strategy involved in use of such a weapon as the ALBM has been hinted repeatedly in speeches and statements by top officials.

Supersonic and hypersonic bombers armed with two or possibly four ALBM's would stand by either on ground or air alert.

On word of a believed attack, they will streak toward their targets. On word that the attack is actual, they will launch their ASM's while still hundreds—possibly more than 1000—miles from enemy borders.

The launched ALBM's will perform at least two key missions:

• They will strike heavily defended areas deep in enemy territory where bombers would come under intense attack.

• They will smash defenses in the path of the bombers much as heavy artillery opens the way for infantry.

Then the bombers with their huge megaton capacity and their great accuracy will strike.

On the other hand, the nearly-sonic CAMAL (Continuously Airborne Missile Launching and Low Level) would carry possibly four to eight ALBM's. However, the plane itself would not be a bomber, too. It would combine being a launching platform with such roles

as providing early warning of attack.

The CAMAL program has been delayed repeatedly while military planners argued over whether they wanted to develop an advanced supersonic nuclear-powered aircraft or merely the best nuclear-powered aircraft that could be put into the air in the shortest time. It appears that the advocates of the latter have almost won.

CAMAL has the same obvious advantage as the *Polaris* nuclear-powered submarine—a means of maintaining an instantaneously ready retaliatory force that would be most difficult to find and destroy.

Some experts say the CAMAL plane could be operational in five years if the program were pushed. Others say considerably less time would be needed.

ALBM itself is expected to be operational much earlier than that.

• **No known defense**—Whatever the method of delivery, there is no known defense against the ALBM once it is launched. The only defense is to destroy the mother planes before launching.

This is one of the prime reasons that the Air Force is developing the North American F-108 with a range of more than 1000 miles. U.S. planners must assume that Russia also is working on development of an ALBM —as well as a long-range supersonic interceptor.

All in all, many in the Air Force believe that the ALBM is such an attractive weapon that it will become the primary method for delivering the Air Force's strategic striking power in the future—both in the atmosphere and in space.

They base this conclusion on the grounds that the ALBM overcomes a number of the drawbacks of the ICBM while retaining most of its principal benefits.

• **ICBM faults**—One of these drawbacks is the stationary ICBM launching site which can be zeroed in by an attacker. Some experts contend that such bases will be vulnerable no matter how hard they are made.

The second prime ICBM drawback is its inflexibility. Once launched it can not be recalled. Also, because its launching site is stationary, the enemy knows the direction of the attack.

Third is the tremendous cost of the hardened ICBM bases. Comparatively, the ALBM is expected to be an economical weapon.

The Navy has also cited these drawbacks as reason for development of the *Polaris*. But some Air Force planners say not even the *Polaris* will have the flexibility of the ALBM.

Therefore, development of the ALBM is a turning point in U.S. strategic planning so far little appreciated either by Congress or the public.

Until now American retaliatory power has been generally seen as twofold: The SAC bomber fleets and the building squadrons of ICBM's.

In many circles, the first of these already partly obsolescent—has be regarded as a weapon of the past tl must be maintained at most five ye or so.

By then SAC is expected to armed not only with the liquid Co vair *Atlas* and Martin *Titan* but t solid Boeing *Minuteman*. Hundreds *Minutemen* are expected to be stalled in hardened bases around t country as well as on such portal platforms as railroad flat cars.

Even before then the United Sta is expected to have a fleet of *Pola* submarines on station.

Many—particularly economy minded Congressmen—have believ there is no need with all of this f the manned bomber, too.

• **ICBM vs. ALBM**—The Air For planners disagree.

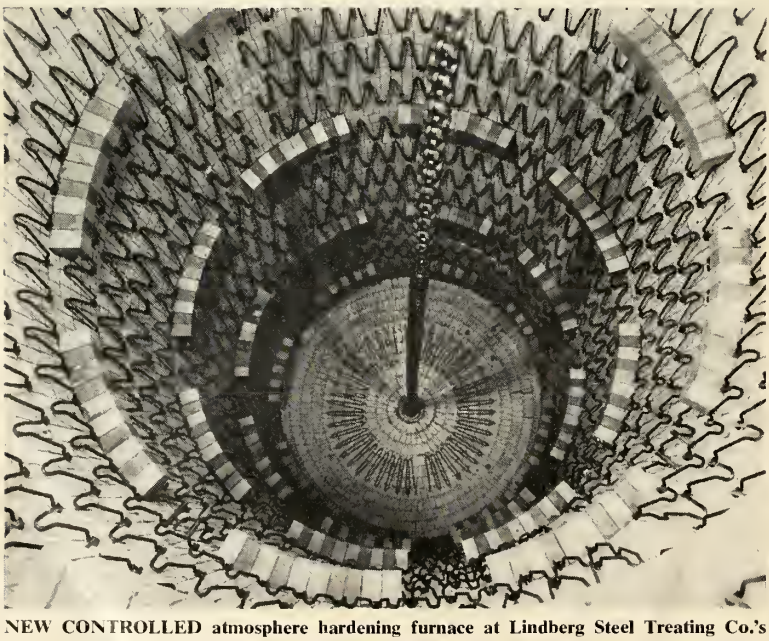
They contend that for America rely on the ICBM alone for its ma retaliatory power would be similar France's reliance on the Maginot Li in World War II.

They argue that the ICBM is d signed to meet a particular type threat and strategic situation. But one can say what the threat and st tegic situation may be 10 to 15 yea from now.

Moreover, they argue that relyi principally on the ICBM leads towa molding U.S. retaliatory force sole as a deterrant of terror.

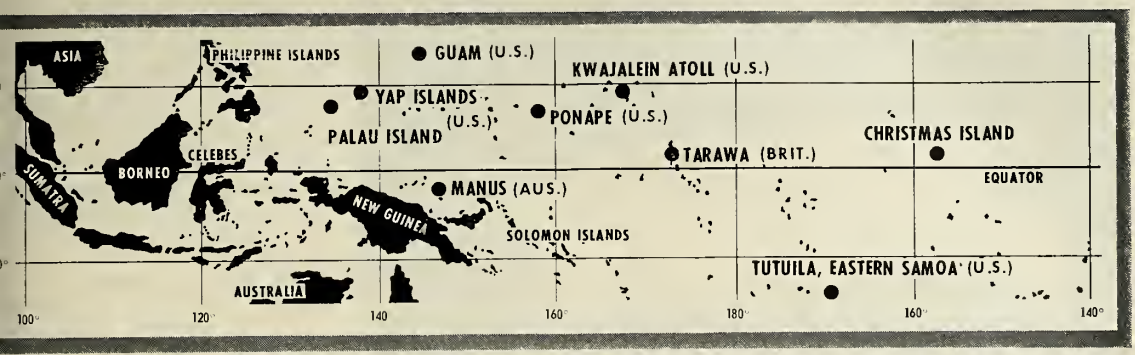
Under such a policy, the Unit States would forget for the most pa about trying to destroy an enem military power and concentrate obliterating X number of his citi and X millions of his people.

Advocates of the policy argue th it would free millions of dollars f building limited war capability. Th also argue that the continuing attem to be ready to destroy enemy milita power can only lead to bankrupt and disaster.



Opponents of the policy arg that it is the highroad to Americ defeat.

They contend that only the abili to destroy Russian military power w deter the Kremlin. For they conte no man can say that the Soviet leade would not be willing to pay 50 milli Russian lives . . . 75 million . . . 1 million . . . if that were all that sto in the path of world conquest.



Therefore, they say the Defen Department today must be prepari the flexible forces that may be need to meet the unknown challenges tomorrow.

Key to such a flexible force is t ALBM.

New Furnace Capability

NEW CONTROLLED atmosphere hardening furnace at Lindberg Steel Treating Co.'s plant at Melrose, Ill. Furnace is big enough to take Boeing *Minuteman's* rocket motor case.

POSSIBLE ISLANDS for equatorial astronautics base.

U.S. Seeks Manus Launch Site

ARPA has engineering plan to spend millions on tying island into PMR; NASA may help in development of site when selected

by William E. Howard

WASHINGTON—Scorpion-shaped nus Island crouching a lazy jump n the equator in the far Pacific y be swept up soon by the Space c.

Unbeknownst to its 15,000 woolly- ed inhabitants, whose major pre- upations are growing coconuts and cticing *mana* (magic)—and some- es when things are very dull, can- alism—Manus is being eyed as an atorial rocket and satellite launch- site. All of which spells millions dollars more in support equipment construction.

The United States, M/R has ned, is formally approaching stralia to obtain permission to de- op and integrate the 20x50-mile canic island into the Pacific Missile nge. Australia holds trusteeship over nus. Embassy officials have in- ated they expect no obstacles when otiations reach the firm-up stage.

Just when this may be is uncer- n, for several other Pacific locations o are being considered. Among them the U.S. trust territory islands of au, Yap, Kwajalein Atoll and Pon- e; the U.S. possessions of Guam and tuila in Eastern Samoa; Britain's rawa Atoll, and Christmas Island, ose possession is disputed by the U.S. and Britain.

Second of a Series on MISSILE SUPPORT

Still another proposal being kicked around the Pentagon is to build Texas Towers in the mouth of the Amazon River. But experts are questioning the feasibility of this idea from the standpoint of both cost and size.

• **Money and time**—Authoritative engineering estimates put the cost of fully developing an island like Manus into a self-sufficient launching base at about $100 million—at stateside prices. In remote areas this figure would be multiplied by a construction cost index of 2.00 to 3.00 and it could go still higher if the project is enlarged or put on a crash basis.

And it would take over seven years to complete at an ordinary pace.

However, early launch capability, planners say, could be achieved for about $23 million (stateside) and in about four years. A task force undoubtedly could bring it about a lot sooner.

Significantly, ARPA hopes to establish a global communications network within four years with Project *Courier*, which would utilize a system of three 24-hour satellites moving in orbit 22,400 miles from the equator. Key to early attainment of this project would be an equatorial launching.

Although it would be possible to launch communications satellites from Cape Canaveral or Vandenberg AFB, it would require more than 40% of the payload to shift them into an equatorial orbit. Improvement in the state-of-the-art in guidance and propulsion also would be needed.

Thus, as one military official puts it, an equatorial launch would be "easier and cheaper in the long run."

• **Safety factor**—Development of one-million pound thrust booster rockets and their attendant safety problems also is spurring consideration of establishing launch facilities in a more remote area. Some missilemen fear this point may be proved when the first attempt is made this fall to fire ARPA's *Saturn* booster—a cluster of eight *Jupiters*—at the Cape. They are wondering what will happen to Cocoa Beach if the cluster explodes.

A third factor bearing on the building of one or more equatorial launch sites is the anticipated future acceleration of space programs. They could in a few years completely overtax present facilities.

In looking over possible Pacific

MISSILE NEEDS would rival World War II development of Manus as U.S. naval base.

locations, planners have established these criteria: The potential site preferably should lie within 5 degrees of the equator, although practical considerations such as international agreements and land availability should not rule out sites within 15 degrees of the equator; there should be maximum easterly overwater travel; it should be situated where existing, programmed and proposed tracking, control and communication facilities may be utilized, and the site should be large enough to support required installations. It would also be desirable for the U.S. to own or have a voice in the control of the area.

• **Elevation 3000 feet**—On nearly all counts, Manus more than fills the bill. Largest of the Admiralty Island group, it lies 200 miles north of New Guinea in latitude 2 degrees south and longitude 147 degrees east.

Important to rocket firings, the topography of Manus is hilly, with elevations ranging from 1500 to 3000 feet. Dense, tropical rain forests cover most of the lowlands, but higher areas are grassy and dotted with pine forests. Mean temperature is about 80°F, the mean relative humidity 85-90%. Rainfall averages 150 inches throughout the year.

Some World War II facilities have been restored, so that the island has an abundant water supply, power and sewage disposal facilities. The Australians also have installed a new wharf, dry dock and refueling facilities and repaved the 6000-foot airfield runway.

These physical advantages are far superior to those of Tarawa Atoll (Latitude 1° 30′ N Longitude 173° E) and Christmas Island (Latitude 2°N Longitude 157°W) which also are situated close to the equator. Tarawa's land mass is only 7¾ square miles compared to Manus' 1000 square miles. Its population is 3600, and while the harbor is good, there is a limited water supply. Christmas Island covers 160 square miles, but has limited water and only "fair weather" anchorage facilities. Its disputed ownership is also a drawback.

Kwajalein, already scheduled for *Nike-Zeus* testing, lies farther away from the equator at Latitude 9° N Longitude 167° 40′E. It is comprised of 80 small, low-lying, sandy islands, has an excellent anchorage in a 655 square mile lagoon, but limited water supply.

• **Other possible sites**—Ponape Latitude 7° N Longitude 158° E) and Palau (Latitude 7° 30′ N Longitude 134° 30′ E) are both U.S. trust territories. Ponape has a total area of 160 square miles and Palau, 216 square miles. Both, however, have quite large populations for their size and therefore present limited opportunity for development of a large installation and room for the operational force. The full complement for a launch site is envisioned as numbering 1200 scientists and technicians and 1700 dependents—a total of 3000.

Tutuila in Eastern Samoa (Latitude 14°S Longitude 170° 30′ W), another U.S. possession, extends over only 76 square miles and has a population now of 22,400. Otherwise it has elevations to 2140 feet and excellent harbor facilities. Guam (Latitude 13° 20′ N Longitude 144° 40′ E) offers 225 square miles, but already is crowded with a large U.S. naval installation and a population of 59,500.

Lack of water would be a restrictive factor on the Yap Islands (Latitude 9° 30′ N Longitude 138° 10′ E) along with available land. The area comprising four closely placed islands covers about 80 square miles and is hilly terrain.

Manus, on the other hand, offe the potential for supporting a lar population with its abundant wat supply and land area. As a down-ran subcenter of the PMR, it would well positioned geographically for n only equatorial, but the launching polar-orbited space vehicles. It cou also serve well as a logistic center f future down-range tracking stations.

An all-inclusive preliminary fea bility study of Manus has been ma by the Ralph M. Parsons Co., L Angeles architectural and engineerin firm, which conceives of developme progressing through five phases—star ing with task force capability.

To fit the island for launching the earliest possible date, there wou be a minimum of construction an maximum use made of governmen furnished portable facilities such oxygen generating plants, power ge erators and (bachelor) housing accom modations.

Over the long haul there would l a requirement for complete technica support and community facilities.

• **Launching complex**—Technic facilities embracing the launching bas tracking station and communicatio center would represent the biggest cas outlay—almost $10 million initially an about $34 million (stateside) to com plete.

The launch complex would includ pads, gantry, buildings for contro service and shops; fuel and oxidize storage; missile check-out and assem bly buildings; a warehouse; hydroge generation and oxygen-nitrogen liqu faction plants, and installations fo instrumentation and control systems.

The communications center woul require buildings for programming receiving and transmitting; an emer gency power plant; and antenn "farms" for transmitters and receivers

Tracking station facilities woul embrace structures for telemetry, dat processing, angle and optical trackers a boresight tower, antennas and trans mitters, and the instrumentation system

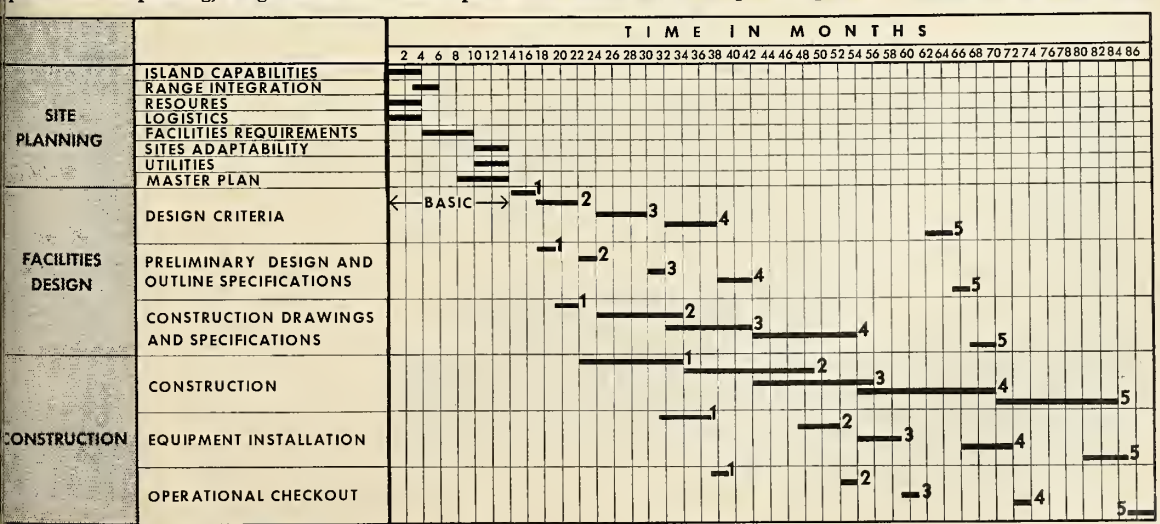
Support facilities, including supply maintenance and administration, woul be concentrated at Lorengau Harbo and nearby Mokerang Airfield. The would require in addition to warehous and storage structures, a tank farm pipelines and pumping station, dock and tanker unloading buoys.

More buildings would be needed t house administrative offices, personne and security offices, a laboratory, en gineering section, a fire station and the other necessities of a large base.

Whether such a comprehensive

n to change the face of Manus or ne other Pacific island becomes a lity, may be decided soon. ARPA icials are reported to be studying h a plan, and although no money s been budgeted yet for construction, agency could initiate engineering dies at any time. Such a site unubtedly would prove its value parularly in the *Dyna-Soar* program.

NASA also is known to be interested in an equatorial launching site, but is yet to demonstrate any wild enthusiasm—such as allocating money.



An official of the space agency, aware of the two-year lead time needed to get such a site ready for a shoot, told M/R that "as of this week, anyway" no programs scheduled during the next two years by NASA would absolutely require such a base. He said that an equatorial orbit would not help the *Mercury* manned space capsule project, because launch and recovery will be "much less" expensive and easier technically off the Cape.

Other NASA experts concede that they would be happy to see ARPA go ahead with a Pacific site. And in that event, NASA might help pay for it.

ESTIMATED COSTS FOR DEVELOPING MANUS ISLAND

	PHASE ONE CONSTRUCTION	PHASE TWO CONSTRUCTION	PHASE THREE CONSTRUCTION	PHASE FOUR CONSTRUCTION	PHASE FIVE CONSTRUCTION	TOTALS
CHNICAL FACILITIES						
UNCHING BASE	$8,400,000	$4,750,000	$3,950,000	$7,500,000	$3,750,000	$28,350,000
CKING STATION	520,000	500,000	1,100,000			2,120,000

TIMATED STATESIDE COSTS	$23,200,000	$25,860,000	$22,120,000	$15,630,000	$14,690,000	
UMULATIVE ESTIMATED ATESIDE COSTS	$23,200,000	$49,060,000	$71,180,000	$86,810,000	$101,500,000	$101,500,000

OP TABLE shows estimated costs for five-step development of Manus into self-sufficient equatorial launch base. In table below quired time of planning, design and construction is plotted. Numbered lines correspond to phases of construction in upper table.

Senate Armed Services Committee has virtually dictated to DOD which missile interceptor system to continue —*Nike-Hercules* or *Bomarc*. The committee slashed $17.3 million from the $22.4 million request for *Nike* installations, but approved the full authorization for Boeing's *Bomarc*.

Manned space vehicle applications may be in sight for new "aerial bobsled" pilot ejection capsule developed by 18-member Industry Crew Escape Systems Committee under ARDC for the F-106 supersonic jet interceptor. Capsule is propelled from aircraft by 7000-pound-thrust solid-fueled rocket. Convair has $1.5 million contract to produce first units.

Smithsonian Optical Tracking Station at Woomera, Australia, on May 1, 3 and 4 photographed *Vanguard I* six-inch satellite at its apogee 2500 miles from earth with Baker-Nunn precision camera. Feat was comparable to photographing a golf ball from 600 miles away and indicates significant advance in tracking capability.

The first of three heat shields of laminated phenolic resins for *Mercury* space capsule has been delivered by General Electric to NASA. Shields will be tested in July.

Complete orbit of the Van Allen radiation belt will be possible with *Vega*, says Convair-Astronautics Manager J. R. Dempsey. The NASA space vehicle to boost large payloads into orbit would be capable of carrying powerful telemetering equipment to give more complete data about the belt. Dempsey says *Vega* also will be used to measure the gravitational fields of the moon and planets and the composition of the atmosphere of the planets.

Steel industry sources feel an alloy of chromium, nickel, molybdenum and aluminum may be the structural metal for the first manned lunar space craft. Relatively low in cost, the alloy withstands temperatures up to 1000°F and can be produced in large volume.

Navy reports "entirely successful" a stage-separation, flight control reactions and systems performance test of the Lockheed *Polaris* May 8. Range and impact were not primary objectives, but the solid-fueled missile traveled 700 miles. In addition, the Navy says a problem has been resolved in the missile's jetevators, which were affected by high temperature in earlier flights.

Keel of first U.S. nuclear-powered guided missile frigate—the Bainbridge —has been laid at the Bethlehem Steel Co. Quincy, Mass., shipyard. Besides twin surface-to-air *Terriers* mounted fore and aft, the high-speed 550-foot warship also will carry ASW weapons and conventional armament.

Marquardt Corp.'s Ogden, Utah, plant will begin delivering *Bomarc* engines on a fixed-price basis this month. At Ogden, the company also is starting up production on the Super *Bomarc* IM-99B engine. These will be cost-plus-fixed-fee units.

Solid-propellant production capacity of 500,000 pounds per month is now reported by Grand Central Rocket Redlands, Calif. The company says it has added about $2.5 million in new R&D facilities in the past eight months and revamped its top management.

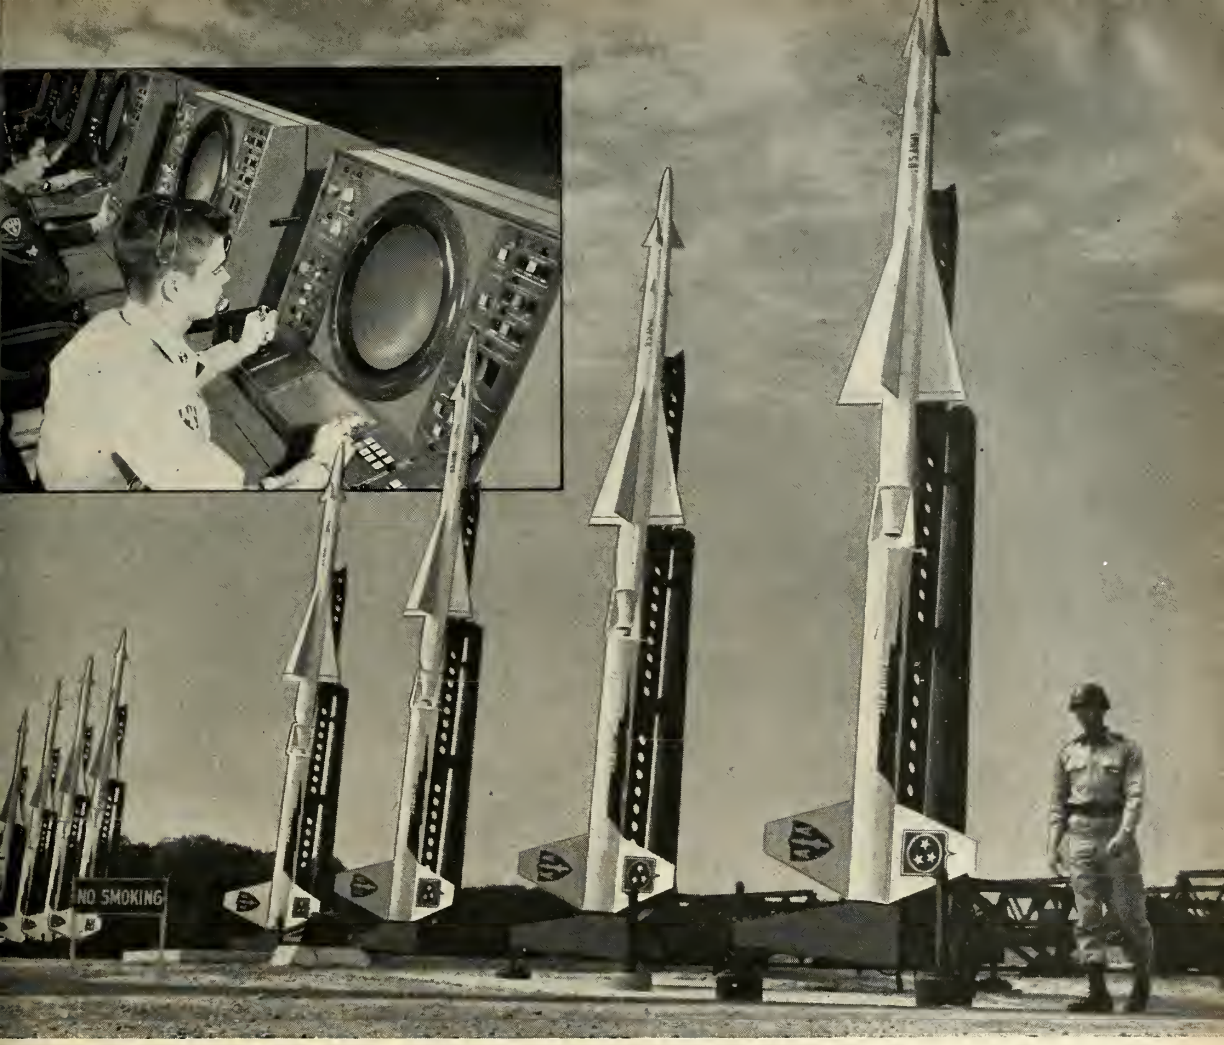
East Coast-West Coast warfare over defense business is rocking Congress. Easterners have introduced legislation which the Westerners claim is directed at taking contracts away from California companies. Meantime, the Los Angeles Chamber of Commerce has whipped up a "task force" of city officials and manufacturers to "defend" the state's missile-aircraft industries.

Delivery of first thrust chamber for ARPA's *Saturn* H-1 cluster of eight *Jupiter* engines has been completed by the Rocketdyne Division of North American Aviation. Static firing of fully-assembled cluster at ABMA Huntsville, Ala., now reportedly is set for mid-October. First flight test may be attempted in the middle of next year at Cape Canaveral.

Cutter Laboratories Berkeley Calif., pharmaceutical firm, has acquired Olympic Plastics Co. of Los Angeles—a supplier of high-temperature plastics for missiles and rockets. Olympic management and personnel will remain unchanged by the merger.

A second X-15 is being built by North American Aviation to carry out the first powered flight of the rocket research aircraft. X-15 No. 1, which has been taken aloft in captive flight still must pass a glide test before the powered flight test of No. 2 airplane.

Satellite network to aid in the search and rescue of lost or stranded vehicles, nose cones and space capsules is being proposed by Space Electronics Corp. Doppler technique would be applied in locating signals broadcast by subminiature radio transmitter in the object sought.



Firing of *Jupiter* IRBM May 6 by AF 864th Technical Training Squadron was to test complete missile operation in tactical configuration—including the warhead and fuzing apparatus working together as a system. The missile successfully completed its programmed 1500-mile flight.

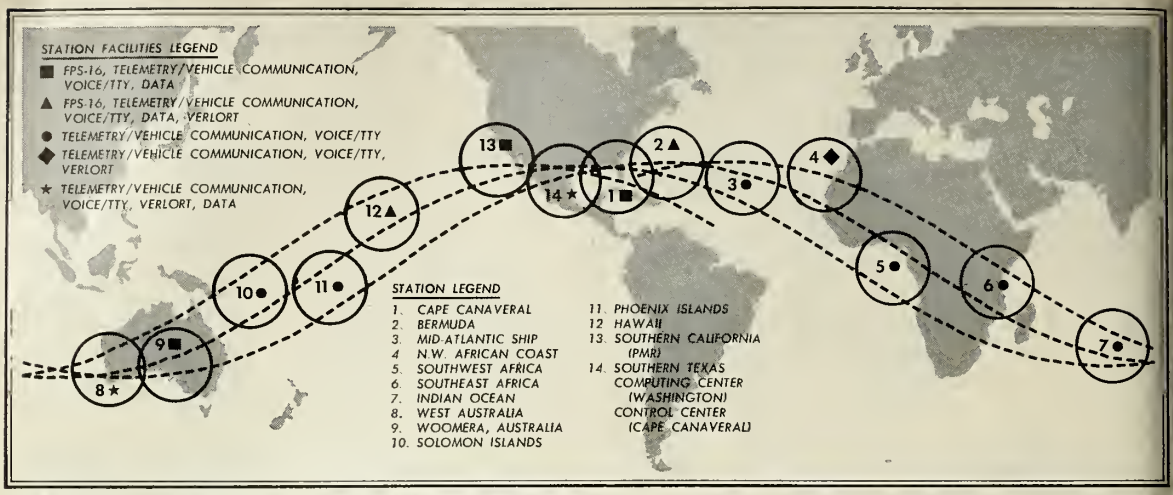
Ryan Aeronautical Co. will break ground this summer for an electronics test facility at San Diego, Calif. New installation will support the company's electronics R&D program.

First Operational *Mace*

THREE TAC missile groups in West Germany are receiving the Martin *Mace*, 1000-mile range all-weather missile capable of delivering nuclear warhead. AF has programmed $193 million for *Mace*, which will be deployed in hard bases.

Martin electronics . . . eyes for missiles

The Missile Master is but one of many complex electronic problems solved by the men of Martin Orlando. Leaping into leadership in today's most dynamic field, Martin Orlando's mastery is soundly based on men with gray matter . . . men who cause new techniques to explode into existence . . . make the future happen today.



From a remote location, the Missile Master electronic control center detects approaching planes, determines "friend or foe", assigns targets for a whole ground-to-air missile battery and gives command to fire.

Martin's new R&D and production facility, located in beautiful Orlando, Florida, offers unlimited growth potential to the man who can make his mark in missilry and electronics. Gray matter is the priceless commodity we seek. Would you come and bring yours?

Senior level openings for Electronic Engineers, Physicists, and Electrical engineers in these design areas: pulse circuitry, electronic packaging, transistor circuitry, production test equipment, digital and analog computer. Opportunities for men experienced in calculating solid state parameters, molecular distribution and quantum mechanics. Send confidential resume to: J. F. Wallace, Director of Professional Staffing, The Martin Company, Orlando 34, Florida.

MARTIN
ORLANDO

A great name in electronics/missiles

ORBITS AND tracking station locations needed for planned range.

NASA's Project *Mercury* Range To Cost $12 Million Plus

World-wide tracking system with unprecedented reliability must be operating within year

by Paul Means and Hal Gettings

WASHINGTON—Final briefing on the Project *Mercury* Range contract is being given by NASA at Langley Field on May 18 for the 18 competing firms.

NASA hopes to award the contract, initially worth over $12 million, to the winning firm or team of firms by July 1. The range must be in operation by May, 1960, when orbiting of the first six dead loads and six animal loads will get under way.

Responsibilities of the Project *Mercury* range contractor will embrace integration of the entire system including the computers at the Goddard Space Center's temporary headquarters (NRL), the master control center at Cape Canaveral, the world-wide tracking system and the direct data relay lines.

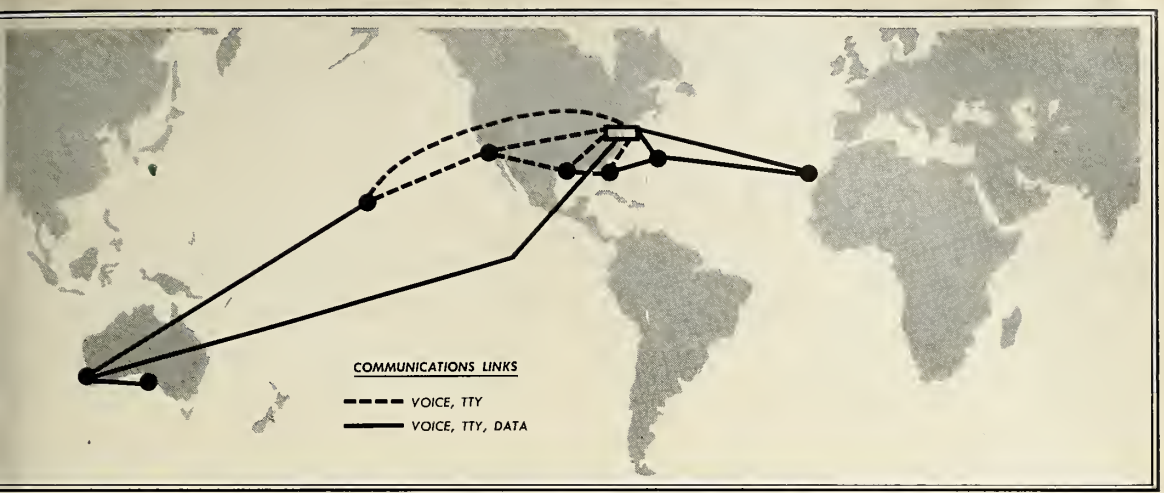
The contractor's duties will also include construction of some of the 14 major stations on the range—three of them to be built at Hawaii, Texas and Bermuda—and integration into the system of 10 sub-stations, which may involve as many as five ships.

• **Unprecedented demands**—The integrated tracking, communications and telemetry facilities for Project *Mercury* will comprise the most complete global data link system yet devised. Requirements for the manned missile will demand links much more complicated and reliable than any needed for unmanned vehicles.

Super-accurate trajectory information, voice communication between vehicle and ground, a world-wide communications link, and complete reliability are all essential to the success of the project.

Plans are to use existing facilities wherever possible. But much new equipment will have to be designed and new facilities installed to complete the necessary instrumentation.

Tracking and communications will be required continuously during launch, post-insertion and re-entry, and periodically during orbit. The system must be adequate for emergencies with impact prediction always available and communication with the vehicle possible.



Basic range functions will include: (1) determination of vehicle location; (2) monitoring of vehicle and occupant status, and (3) abort and re-entry initiation control.

Radio communications with the vehicle will call for two voice channels (UHF and HF), one command, and two FM/FM telemetering channels.

Inter-station communications will include voice, teleprinter, and data circuits. Reliability requirements are 99.99% for the U.S.-Hawaii cable circuits and as high as the state-of-the-art will allow for overseas radio.

One of the best-kept secrets will be the frequencies on which the Project *Mercury* radios send and receive. This is to keep curious hams from tuning to the frequency and accidentally setting off the abort mechanism or making the capsule give other premature responses.

• **Hint of Cost**—Entire cost of the

DIRECT COMMUNICATION links needed between tracking stations and computing centers.

ange has not been announced, but revious NASA budgets provide $5,-50,000 for the construction of the outhern Texas station and $12,500,-00 for integration and construction f the range.

Final make-up of the *Mercury* ange will depend a great deal on its erformance during the deadweight nd animal payload orbits beginning n mid-1960. NASA officials think it ill take a year and a half of testing o prove the range, capsule and ooster.

Basic idea is to get the system to perate satisfactorily without manned ontrol of the capsule, so that the di-ect voice communications system and he astronaut's controls in the capsule ill be only added safety measures.

Ideally, the astronaut will not have o use any of the controls at his dis-osal, and NASA will not let man ide in the capsule until the system has roven that it doesn't need him.

Insert into the near circular orbit apogee 120 miles, perigee 110 miles) ill come about 400 miles north and ast of the Cape Canaveral launching ite. Retro-firing will commence on the hird orbit 600 miles from the West Coast, with impact in the Atlantic Ocean about 400 miles from Cape Canaveral.

Almost continuous tracking is eeded in order to get an accurate stimate of impact area at any moment hat the capsule needs to abort from ts orbit.

The orbit is designed to keep the stronaut over friendly territory at all imes so that the capsule can be re-overed regardless of where in the rbit it had to abort.

Meanwhile, training, indoctrination and education of the seven astronauts who will "fly" the *Mercury* capsule has begun at Langley Field, Va.

The initial phase of the program will include: 1) science education; 2) space flight familiarization; 3) operation of the *Mercury* vehicle; 4) participation in vehicle development; 5) high-performance aircraft flight training; 6) familiarization with support equipment and launch crew operation.

The program will use existing research, development, training, and test facilities of the armed services, industry, and educational institutions.

Mach 1400 Shock Waves Created

EVERETT, MASS.—Interplanetary shock waves, which travel at speeds in excess of 1,000,000 mph (Mach 1400), have been duplicated in the laboratory.

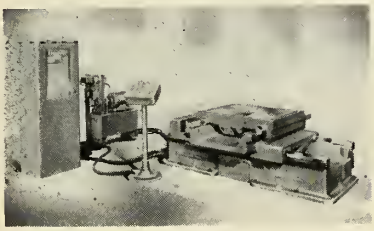
Using an electrical charge of 4,000,000 kilowatts in a 30-inch shock tube, scientists at Avco's Everett Research Laboratory successfully reproduced for the first time the thin shock waves which result from solar flares. A temperature of 1.5 million degrees was generated by the ionized gas wave which was contained within a magnetic "cylinder."

These fantastic conditions were obtained under the supervision of Dr. Arthur Kantrowitz and Prof. Thomas Gold. Dr. Gold first advanced the theory that interplanetary shock waves, generated by solar flares, were responsible for "squashing" the earth's magnetic field with great suddenness. He suggested that the shock wave travelled by collision of force fields surrounding hydrogen ions and electrons. The "thin" shock wave produced in the laboratory confirmed this theory.

Avco has been responsible for a great deal of the research work on reentry problems associated with the *Atlas, Titan,* and *Minuteman* missiles. Their advanced shock tube experiments have yielded much data on re-entry heating. The facility was the first to obtain the Mach 25 speeds needed for problem study.

Much of the hypervelocity research has been sponsored by the Air Force Office of Scientific Research in Cambridge, Mass.

Another significance of this experimental work lies in the clearer understanding of very high temperature (ionized) gas called "plasma," its nature and how to confine and direct it by magnetic fields. One and one-half million degree gas temperatures are obtained in the electric shock tube. At this temperature, all known matter would vaporize instantly. In the apparatus, this ultra hot gas is confined within a "magnetic wall."



By using a rarefied mass of hydrogen, pushed by a magnetic field tightly confined in the shock tube on every side except one, velocities in excess of 1,000,000 miles per hour were obtained. The four billion watt electrical impulse needed to achieve this is produced by discharge from condensers in two millionths of a second.

The electric shock tube which produced this thin, high-speed shock wave was developed by Dr. Richard Patrick, an Avco physicist, expert in the young science of magnetohydrodynamics (MHD). Earlier experiments at the Avco-Everett Research Laboratory had obtained high temperatures in a "pill-box" apparatus which produced cylindrically converging shock waves in deuterium gas. Drs. G. Sargent James and Harry Petschek and Nelson Kemp, all physicists at the laboratory, are widely known for their contributions to current understanding of MHD.

Tape-Controlled Table Works to Millionth-Inch

A new positioning table capable of accuracy equal to the finest jig borer has been developed by **The American Tool Works Company,** for application to heavy-duty production drilling and boring jobs, both short and long run.

Numerically controlled by an endless punched tape, the 8000-lb. position table is of rugged construction. It can support heavy workpieces, positioning the work anywhere within a 30" x 20"

working area with an accuracy of ±.000250" (non-accumulative) on either axis, or repeating a position within ±50 millionths (.000050"). And, according to company engineers, the table can hold these accuracies even when installed out in the shop.

Unlike a jig borer or a spacer table with set stops or dials, the new machine is fast in positioning and does not depend upon the skill of the operator. The table travels automatically from one position to the next, moving simultaneously on both axes ("x" and "y") at the same speed from start to finish of movement—yet with no over-travel. Actuation is entirely hydraulic, eliminating both traversing screws or nuts and their associated back-lash problems and motors with their inertia problems. Because the hydraulic actuating cylinders are in a balanced closed circuit, the table is rigidly held in position when the pistons are at rest. There are no clamps to produce a shift in table position.

The new tape-controlled table, reports American Tool, is suited for job-lot runs, large or small. With the endless punched tape, as soon as one workpiece is complete the machine is ready for the next without rethreading of the tape. Intermediate positions on the endless tape cannot be lost, since the hole pattern, once punched, remains in proper relationship for the entire life of the tape—good for thousands of pieces. The tape's small size also facilitates economical storage.

The complete tape control system of the machine is housed in a pressurized cabinet, designed to keep out shop dust and dirt. An operator's control panel is mounted on a separate stand which can be moved about for maximum convenience.

A punched tape can be installed in the control system cabinet in a few seconds. It can be inserted under the reader in any position inasmuch as the control unit will automatically locate the "start." This "start" is usually the loading position directing the table to travel to its furthest front position. This permits the operator to load and unload his workpiece with a hoist, if needed.

During operation, the punched tape is read pneumatically by a flow of low-pressure air. This air, passing through the holes in the tape, actuates a selected series of switches, signalling the electronic control system where the positioning table is to move (in terms of "x" and "y") to arrive at the next working location. The electronic circuits then actuate the machine's hydraulic system to perform the required travel.

Feed-back signals—which tell the electronic system (product of **The Sperry Gyroscope Company)** where the table is presently located and announce its arrival at the new position—are supplied by two Farrand electronic scales, one each on the "x" and "y" coordinates. Each scale is made of glass with embossed wiring, and is read by a slider which maintains a .005" air space away from the scale surface. By virtue of this air gap, wear of any kind is prevented. These electronic scales are located in two hermetically sealed housings.

The use of air pressure for reading the punched tape prevents elongation or opening up of the punched holes and preserves accuracy of the original tape. There are no mechanical steel tape-reading fingers of any type in the system. The same air pressurizes the control cabinet, keeping out dust and dirt.

Valve Assembly Features Titanium Bellows

Packless valve stem assemblies with seamless bellows made of titanium, believed to be the first ever made from the light metal, are being produced for a homogeneous reactor project at Oak Ridge National Laboratories by Fulton Sylphon Division, **Robertshaw-Fulton Controls Company.**

The assemblies are being used in an all-titanium primary reactor loop de-

signed to carry a highly corrosive uranyl sulphate solution at high temperature and pressure.

Experiments showed that gold-plated bellows were unsatisfactory.

Performance requirements for the bellows assemblies were unusually high. They called for operation at 300°C at pressure of 2500 psig (constant), with 1/8" stroke, spring rate not over 1250 lbs. per inch. Outside diameter of the finished bellows is about 1¼".

Problems in manufacture of the bellows concerned basic difficulty in forming titanium, due to its low elongation properties. The bellows were made from grade 55 sheet titanium.

Safety Claimed for Bi-fluid Tester

Amthor Testing Instrument Co. announces "the first successful bi-fluid tester, type 472, that can test oxygen equipment, and still employ oil or glycerine in the separate piston-cylinder chamber, without any danger or hazard."

The Amthor BI-FLUID tester offers critical performance in testing all types of equipment that might present the same problems as oxygen equipment.

Constructed with a 2-piston hydrau-

From drawing board conception to outer space performance—CDC offers complete responsibility. Building systems on paper is one thing. Building them in the shop is another. Hardware currently performing in the upper atmosphere and out in orbit attests to the fact that CDC does both, and does them well. CDC offers you across-the-board services in rocket and missile systems: propulsion, electronics, telemetry, instrumentation and ground support. One responsibility for all! Cooper Development Corporation

SCIENTISTS, CREATIVE ENGINEERS—INVESTIGATE THIS FIELD WITH A FUTURE. CHALLENGING WORKING ENVIRONMENT IN SOUTHERN CALIFORNIA.

lic hand pump, this new tester, the company claims, surpasses any other previous tester in operating performance due to its ease of operation. The volume per stroke of the large pump piston is approximately 8 times greater than that of the small pump piston, thereby allowing quick filling of the unit under test. The large pump piston automatically becomes inactive with increasing pressure, thus enabling the operator to create 10,000 P.S.I. with approximately 17 lbs. hand pressure.

This new BI-FLUID design is said to be economical, accurate and safe and eliminate the possibility of contamination and risk of oxidation. Pure water which may be used as the hydraulic fluid for the gauge or unit under test is easily removed and never reused; thus production time is saved, while the use of oil or glycerine as the hydraulic fluid for the piston-cylinder assures accurate and sensitive performance.

Instrument Measures Material Erosion Rate

A new technique for measuring erosion is provided by **Era Engineering Inc.'s** Material Erosion Rate Instrument (MERI). This instrument will measure the thickness of any material under free flight or laboratory conditions. The output is in the form of an electrical signal which can be recorded on magnetic tape or telemetered to a remote receiver.

This new technique for continuous thickness measurement consists basically of impregnating a small element of the eroding structure witb a radioactive material and measuring the resulting radiation as a function of time. The radioactive material is uniformly distributed throughout a small cylindrical hole drilled perpendicular to the surface to be studied.

As the surface is removed, the activated material is carried away in proportionate amounts. The output of the instrument is a direct measure of the amount of activated material remaining as a function of time and thus a measure of the thickness as a function of time. For any given material (metal, metal oxide, plastic, etc.), a binder with essentially the same physical and thermal properties as the original material can be procured to hold the few micrograms of radioactive emitter used. This insures that the surface of the activated plug coincides with the surface of the structural material.

The MERI consists of a small detector probe, electronic circuitry for measuring the radiation level, and an activated plug. The entire system is subminiaturized and has been tested for operation in a rocket vehicle environment. It can be supplied with internal batteries, or can operate from external power supplies.

D-K Analyzer Detects Contaminants

Delsen Corp. has developed the "D-K Analyzer," a portable, nondestructive, direct reading instrument which measures the dissipation factor and dielectric constant of any non-conductive media. Several probe forms are available which facilitate use of a single instrument for measurements of both solid and liquid media.

The instrument can be used to investigate effects of processing and formulation variables on the dielectric properties of solid insulating materials, to detect non-uniformities in the electrical properties of insulators, and to inspect incoming materials for both uniformity and conformance to standards.

In many cases tbe "D-K Analyzer" can be used to detect the presence of moisture or other contaminants in solids, powders or liquids, as well as to measure the dielectric properties of electrical insulating liquids such as transformer oils. As a tool of the physical chemist, dielectric properties can be used to distinguish between isomers of the same organic compound to detect tbe presence of weak organic acids, and to detect moisture in many organic liquids.

The "D-K Analyzer" is available as a battery-operated unit for portable use, or as a laboratory instrument with a plug-in power supply. In either form the "D-K Analyzer" measures 9" x 12" x 9" and weighs less than 15 pounds.

Coaxial Switch Fits In Small Package

The Miniature Coaxial Switch series was developed by the **General Communication Company** to provide the characteristics of its Standard Coaxial Switch series in the smallest possible package.

Features are:

High reliability, low VSWR, low crosstalk, low input impedance and long life.

Dimensions: 3-7/32" height x 1-1/2" diameter. Electrical Characteristics: frequency range—0 to 6000 mc.; VSWR—1.3:1 max. to 6000 mc.; insertion loss—less than 0.2 db at 1000 mc.; less than 0.5 db at 6000 mc.; RF Power Rating—100 watts at 3000 mc.; voltage rating—500 volts peak; crosstalk—greater than 60 db at 1000 mc.; greater than 40 db at 6000 mc.; impedance—51 ohms; operating voltage—20 to 30 volts DC; operating current—1.5 amp. max. at 28 volts.

Mechanical Characteristics: type—single-pole, two-position; operative life—100,000 cycles minimum; temperature range— −55°C to +55°C; switching rate—40 cycles per minute; switching time—0.15 second; RF connector—Type N; Power connector—Type GS02-10SL-3P-113; weight—12 ounces.

NEW AVCO RESEARCH CENTER

Space age research gets a new headquarters

One of the largest and best-equipped research facilities in the nation is the new 16-million-dollar Avco Research Center at Wilmington, Massachusetts. Here, research and development in space age technology is already being conducted in areas ranging from missile re-entry to satellite design. From work such as this—and equally important work at the nearby Avco Research Laboratory—will come further contributions to national security and the conquest of space!

single transformer for different jobs. The Eder-Lite slender extension tubes fit through holes, inside crevices, around corners. Use a flexible tube, semi-flexible, or rigid tube of various lengths and angles. You get a bright beam of light right on the area you are examining.

Mirrors provide vision and illumination around corners and curves and through holes (such as spark plug holes in engines). The new 1/8" diameter Eder-Lite will get light into the tiniest crevice. Magnifiers provide light and 10-time magnification for precision work. The "Bull's Eye" attachment gives a beam instead of diffused light.

Eder "directed light" eliminates glare. The illuminated inspection area stands out by contrast, improving visibility. The metal housing also protects the light bulb from breakage and prolongs its life.

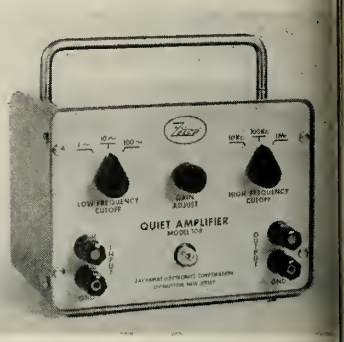
Electron Diffractograph Offered For Metallurgy

A new model of the Trueb, Taeuber Electron Diffractograph is announced by the United States distributors, **New England Scientific Instruments Co.** This instrument is useful for research on the structure of materials. It is currently being used in solid state studies, in metallurgy, in chemistry, and in many other applications. It is valuable for the study of thin layers and of surfaces including changes induced thereon by processes of friction, lubrication, polishing, corrosion, temperature variation, catalysis, radiation damage, chemical agents, phase changes and so on.

The diffractograph can be used either for direct observation of the diffraction pattern on a fluorescent screen or for photographic recording. Photographs can be taken on plates, roll film, or on a special cinematic camera which permits structural changes to be continuously recorded. The observation chamber has three viewing ports with a fluorescent screen three inches in diameter which can be pivoted externally.

The instrument contains a metal discharge tube with a cold cathode of effectively infinite life which generates the electrons. The beam is accelerated through a variable potential of 20 to 50 KV applied to an anode diaphragm which is positioned in a self-centering cone. The beam axis adjustments are easily made by means of independent plane and spherical movements of the alignment sections. The beam diameter is less than 10 microns which results in an optical line width of less than 100 microns. Specimens more than an inch in diameter can be introduced into the air lock and studied under variable temperature conditions up to 900°C, a continuous measurement of the temperature being provided by a thermocouple element. The sample can be moved and rotated so that its entire surface can be explored. A special device has been provided to neutralize the charge which would otherwise collect on the sample during an exposure.

The Trueb, Taeuber Electron Diffractograph is suited for the currently used methods of electron diffraction study: Debye-Scherrer, Kikuchi, convergent beam of large aperture, paral-



lel beam and so on. Two electromagnetic lenses of variable focal length make possible the following arrangements: focussing on the fluorescent screen for powder diagrams, focussing on the sample for small beam diffraction, focussing above the sample for shadow microscopy, observing an image of the sample at 50 times magnification, and observing magnified reflections from the sample.

Quiet Amplifier Has Varied Use

The model 108 Quiet Amplifier of **Zacharias Electronics Corp.** is an ultra low noise instrument which features a gain of 100 over a frequency range of 1 cycle-per-second to 1 megacycle-per-second. The equivalent input noise is 1.5 microvolts maximum for a 10 kilocycle bandwidth anywhere between 10 cycles-per-second and 1 megacycle per second, and 4 microvolts maximum for a 100 kilocycle bandwidth. An input impedance of 8 megohms minimizes loading of circuits under test. The 600 ohm output impedance is suitable for driving a wide variety of loads. A maximum output of 10 volts RMS is available for high level applications. Selectable low-frequency and high-frequency cutoffs further improve the sensitivity of the instrument when the entire bandwidth available is not required. Typical applications of the model 108 include its use as an ultra-sensitive preamplifier for null detection apparatus, A-C vacuum tube voltmeters, oscillographic and magnetic tape recorders, medical and geophysical electronic instruments, accelerometers and many types of transducers.

'Thumper' Cable Shows Insulation Faults

Associated Research Inc.'s "Thumper" is a device used to pinpoint within a few feet defective insulation determined through high-potential testing of electric power cables, or faults developed in service. This precision fault locating is achieved regardless of length of cable by the conversion of high-voltage, low-current output of a DC high-potting instrument into a high-voltage, high-current impulse supply.

A sphere gap is adjustable from the outside of the unit so that the breakdown voltage may be varied to suit the fault of the cable being tested. The test potential and repetition rate of the pulse voltage may be varied to suit existing conditions. The exact location of the fault may be determined in many cases by moving along the cable and listening for the point at which the tracer signal breaks across the fault.

The "Thumper" Fault Locator is rated at 25 KV. The great available energy permits high instantaneous peak currents which result in an extremely loud discharge, even though the fault is some distance from the point of test.

This instrument is designed for use as an accessory with any DC high-voltage breakdown tester or power supply.

The unit is approximately 15" wide x 5" deep x 15" high and weighs about 90 pounds. Price is $995.00.

what is entropy?

Heat lost except at absolute zero?

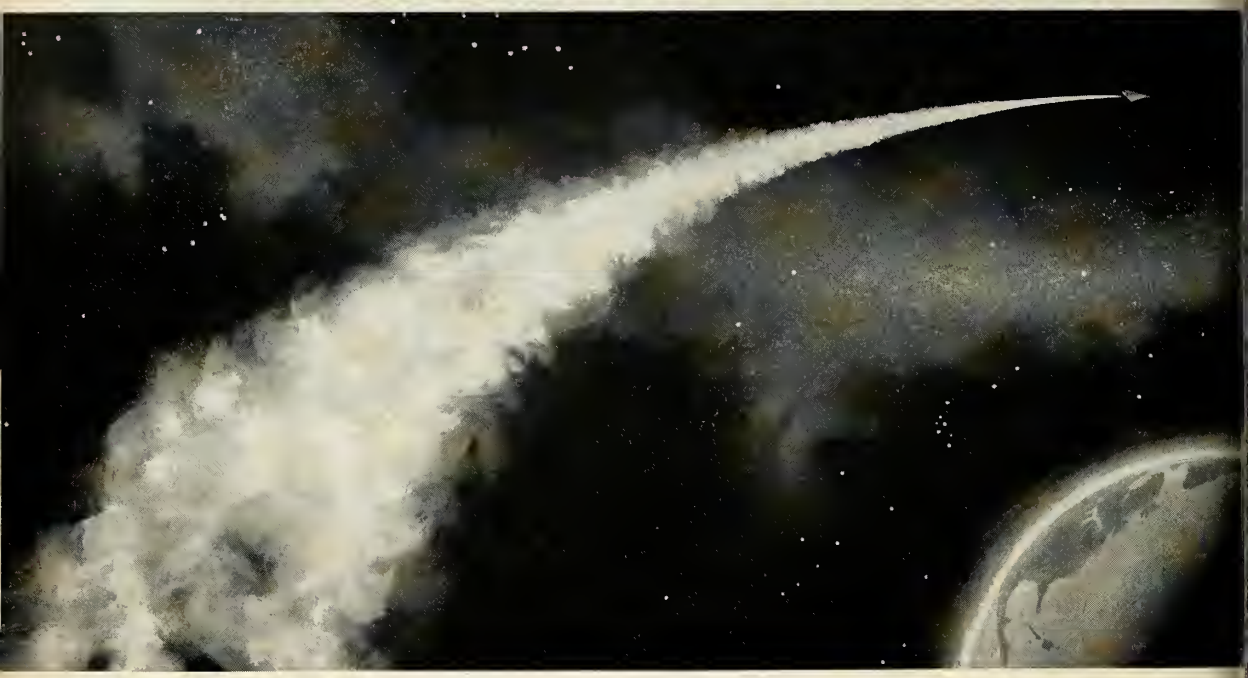
A measure of disorder?

A statistical probability of state?

The gradient of a scalar?

Macrocosmic phenomenon or microcosmic, too?

The fundamental concept of entropy is involved in many phases of our technology. Hence we have a fundamental need to know everything we can about its significance. This knowledge is critical to our work of energy conversion.



Thus we probe and inquire, search without wearying — call upon the talents of General Motors Corporation, its Divisions, and other individuals and organizations — for a complete appreciation of all phases of scientific phenomena. By applying this systems engineering concept to new research projects, we increase the effectiveness with which we accomplish our mission — exploring the needs of advanced propulsion and weapons systems.

Energy conversion is our business

Division of General Motors,
Indianapolis, Indiana

DYNA-SOAR

Dyna-Soar (for dynamic soaring) is a joint project between the Air Force and the NASA, and is an attempt to solve the technical problems of manned flight in the sub-orbital regions. Advance knowledge on the project indicates how a boost-glide vehicle can operate from the outer fringes of the atmosphere where it can maneuver and be recovered undamaged. Studies show that by varying the original rocket boost, and thus the velocity, and with the control available to the pilot, the Dyna-Soar aircraft can circumnavigate the earth, followed by a normal and controlled landing. Boeing Airplane Company, one of the competing companies for the development contract for the complete boost-glide system, has delegated to RCA the responsibility for the development of important electronic components of Dyna-Soar.

Top Scientists Find *Argus* Opening New Avenue of Experimentation

First detailed discussion of historic tests confirms theories of Christofilos, who calls for further projects

by Charles D. LaFond

WASHINGTON—Three small A-mbs, detonated high in the atmos-re over the South Atlantic in the mmer of 1958, created a new avenue scientific experimentation.

The significance of the experiment, w well known as *Argus*, was stagger-. For the first time in history, geo-sical phenomena on a world-wide le could be measured and related to quantitatively-known cause. This, of rse, was the injection into the th's magnetic field of a known quan- of electrons of known energies at rticular time and position in space.

The results of this experiment con-ed the theories presented to the ernment in a proposal for the ture by Nicholas C. Christofilos in 7. Although the overall story of *gus* was broken earlier this year, ly recently have the details been re-sed. This is a summary of the whole ies of events we now call the *Argus* eriment.

• **History of effort**—Prelude to *gus*, according to Dr. Richard W. rter, Chairman of the Technical nel of the Earth Satellite Program the U.S. Committee for the Inter-tional Geophysical Year, was pro-led by the first U.S. IGY satellite, *plorer I*, launched on Jan. 31, 1958. e existence of a belt of high-in-sity corpuscular radiation near the th was discovered accidentally while mary cosmic rays were being mea-ed in the upper layers of the atmos-ere.

Telemetered data indicated that the ellite was passing through regions of h high intensity that the counting cuits, including the Geiger-Mueller e itself, were saturated. The levels d lower limit for the radiation mag-ude were established approximately

The joint space symposium at the 96th Annual Meeting of the National Academy of Science, co-sponsored by the American Physical Society and the National Aeronautics and Space Administration, drew upon the aristocracy of this nation's scientific community.

Response to the symposium was overwhelming. Open-to-the-public advance notices resulted in standing room only in the Academy's Great Hall and latecomers were queued out of the building.

Discussion of the problems, recent results, and future research in space science were presented in three principal sections: a detailed discussion (for the first time) of the Argus experiment, and a two-part program on problems in space exploration.

by subsequent laboratory comparative studies. Data from *Explorer III* in March, 1958, further substantiated the earlier findings.

Preliminary conclusions on existence of a radiation belt by Dr. James A. Van Allen and his staff at the State University of Iowa were presented before the Academy last year. The belt, beginning at just beyond 1000 miles from the earth's surface, was postulated to extend another 2000 miles in depth (outward).

Because the observed intensity increased so rapidly between 700 and 1000 km, it was concluded that the primary radiation was being restrained or trapped by the earth's magnetic field and thus consisted of charged particles with energies much less than those associated with cosmic rays.

To continue the research, the IGY Committee requested and received two additional *Jupiter C* vehicles. Of these, only *Explorer IV* attained orbit.

At the same time that IGY planning was in progress for *Explorer IV*, Advanced Research Projects Agency of the DOD was planning the *Argus* experiment. Thus, Dr. Porter made it clear that despite erroneous reports *Argus* was a Pentagon project, not IGY. The confusion resulted from the fact that *Explorer IV*, although intended to gather natural radiation phenomena, would also be in a position and was instrumented to measure the artificially-produced radiation to be injected by the *Argus* effort.

On Aug. 27, 1958, the first *Argus* nuclear blast occurred, producing a 1 to 2-kiloton yield (altitude 480 km; long. 12° W, lat. 38° S). This was the first of three rockets to be fired from the U.S.S. Norton Sound in the South Atlantic.

As *Explorer IV* continually passed through the *Argus I* artificial radiation shell, its radiation instruments measured and reported to ground stations the absolute intensity and position of the trapped radiation. Electron-density rate of decay as a function of altitude and observations of shell thickness were studied to provide a better understanding of natural radiation electrodynamics.

Two more firings on Aug. 30 and Sept. 3 resulted in similar recorded phenomena.

Near the end of September—its batteries exhausted—*Explorer IV* sent its last observation. The intensity at that time was barely discernible above the natural radiation background.

• **Original proposal**—As has been fully reported before, the proposal for detonating a small thermo-nuclear bomb in space originated with Christofilos of the Livermore Radiation Laboratory, University of California, in October 1957. His proposal, in short, was based on these theories:

• Charged particles released in the

Bloodhounds ready for launching during acceptance trials at Woomera

EFFECTIVE

More advanced Bloodhound for defence of UK confirms particular suitability for European defence needs

Already in operational service with the RAF and adopted by non-NATO Sweden, Bloodhound Guided Weapon System is now to be further developed for the RAF.

This developed Bloodhound possesses substantially increased operating range and altitude, with advanced technique ensuring still greater lethality at these increased ranges and heights. Low altitude performance is further improved to counteract the threat of low-flying targets.

By developing Bloodhound to meet a threat, the RAF is making use of an existing system which obviously economic and operational advantages.

Proved in many hundreds of test firings; built Europe's largest missile-manufacturing complex; particularly suited to European defence needs, Br Ferranti Bloodhound forms *the world's most effecti fence system now and for many years to come.*

Security forbids publication of full details, but following facts about Bloodhound can now be given:

earth's magnetic field would be trapped under certain conditions; thus, it might be possible to extrapolate the electron-layer idea into a global experiment.

• By its nature, an A-bomb burst releases very energetic electrons. These, injected at one point in the atmosphere, could follow the earth's magnetic lines. A portion of these electrons would be trapped in the magnetic field and thence oscillate in a north-south direction.

• Because electrons in this field would drift eastward, an A-bomb burst could envelop the earth with a thin shell of trapped electrons.

• Moreover, within a relatively short time, scattering and diffusion would dissipate the radiation shell. Calculations indicated a survival time for the radiation shell of the order of several days with proper burst position and altitude.

• Finally, calculations showed that the desired effect could be established and measured using a small A-bomb.

The Christofilos proposal to carry out such an experiment was examined and accepted as feasible by a scientific review group; the decision to proceed with the experiment by ARPA was made in April, 1958.

• **Initial planning**—The detection instruments and associated electronics for the *Explorer IV* satellite were designed and produced within Dr. Van Allen's department of physics at the State University of Iowa. As indicated earlier by Dr. Porter, the instruments were designed around the dual need for studying both the natural and the artificially injected radiation belts. A breakdown of the characteristics of the detectors employed is shown in Table 1.

To meet numerous requests from readers, M/R has made available reprints of the recent series of articles by Dr. S. Fred Singer on the meaning of Project Argus. Copies of the combined series may be obtained by writing to the magazine. The rate is 50¢ for a single order (bulk rates on request).

In addition to their cognizance over detection instrumentation, the Van Allen group also studied and made recommendations for firing sites. Several considerations led to the choice of bomb-burst sites, said Van Allen:

• Safety reasons demanded an isolated firing area.

• To maximize trapped particle lifetime, an intermediate latitude was needed to permit comprehensive observations. A low latitude would decrease lifetime because of particle collisions in the denser air. At a high latitude, the corresponding magnetic line of force extends farther from the earth in the equatorial plane. Perturbations in the extremities of the geomagnetic field would cause a decrease in trapped life time.

• The radiation-shell position had to permit satellite interception at a low altitude and through an orbit inclined at a maximum of 51° to the equatorial plane. (This was a practical limit imposed by the existing U.S. facilities at that time.) Also, an intermediate latitude was preferable because the satellite orbit would intercept the shell at a less oblique angle.

• Since it was known that the natural radiation intensity diminished rapidly at a given altitude with distance northward or southward from the magnetic equator, background radiation would be less at an intermediate latitude.

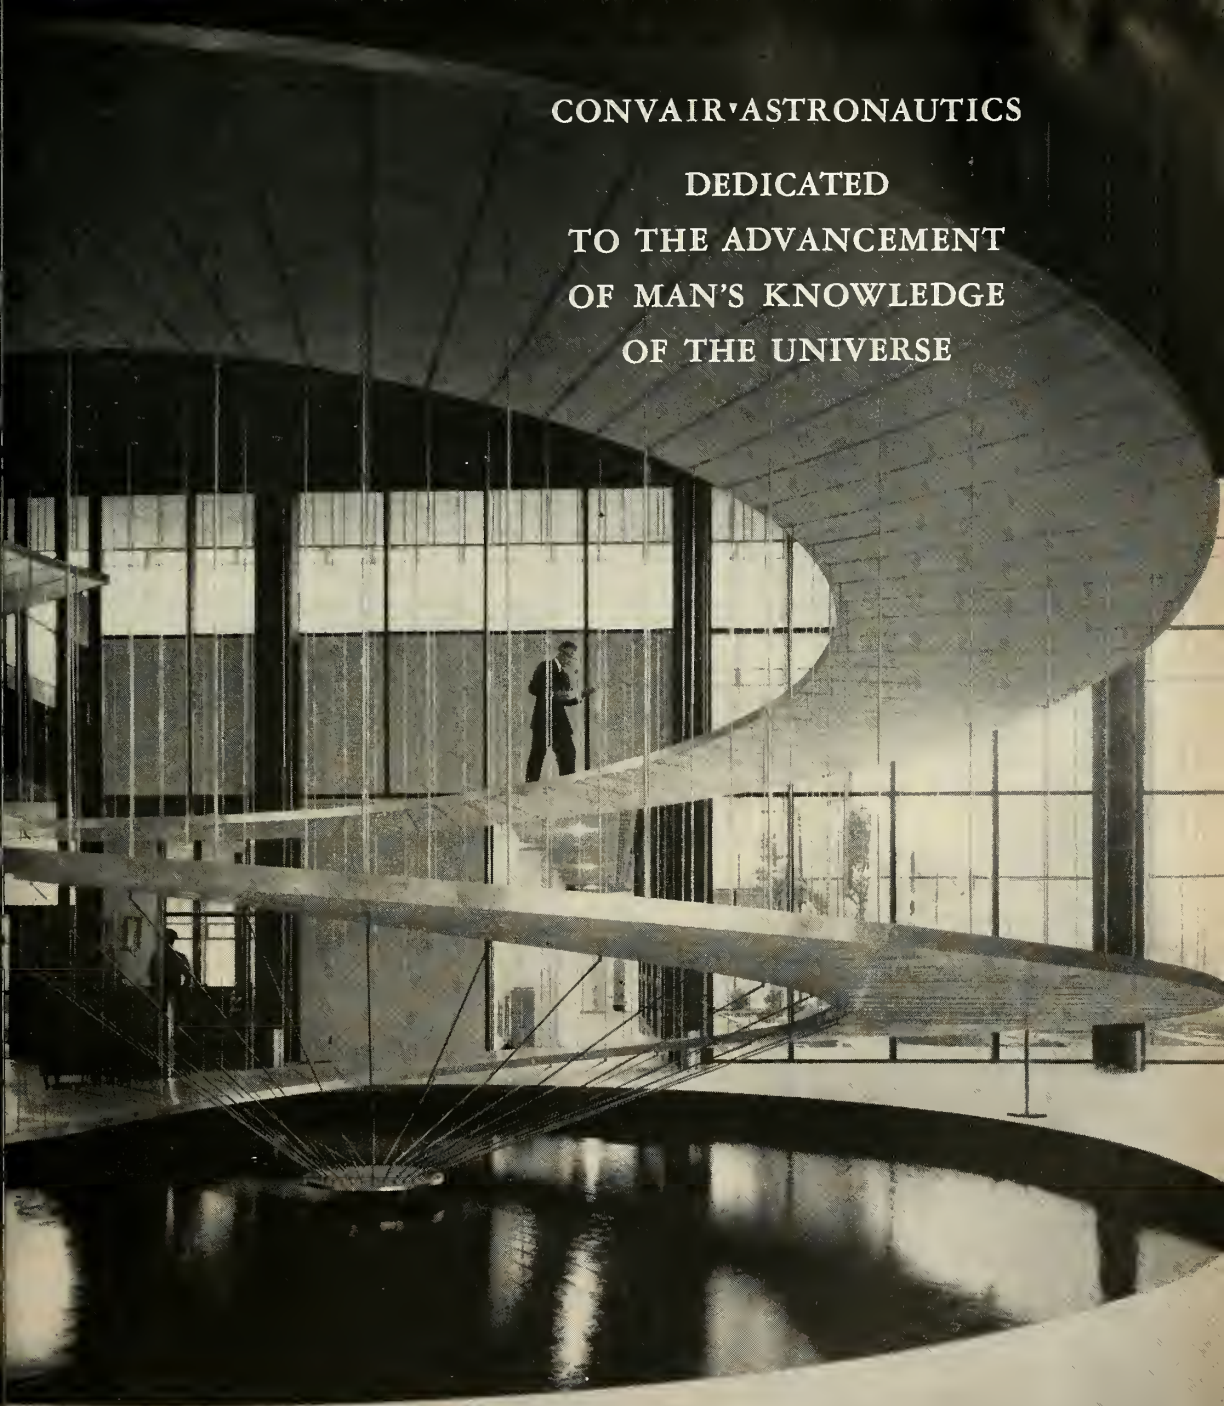
• In the South Atlantic, the scalar magnitude of the geomagnetic field is less than that at any other point on earth at intermediate latitudes. Therefore, trapped lifetime of charged particles, for a given burst altitude, would be longest there.

• A good observation site near the point conjugate to the firing point was needed—preferably an island. (The Azores met these requirements.)

• **Observations**—During the month preceding *Argus I* (July 26 to Aug. 26), many observations served to establish the detailed spatial dependence of the natural, trapped radiation and many of its properties in terms of the characteristics of the detectors devised for the two-fold observation program, Van Allen said.

The geometric relationships between the orbit of *Explorer IV* and the chosen magnetic shell are easily calculated in theory. In a favorable case, the satellite orbit would intersect the *Argus* shell four times during each revolution around the earth. These intersections would be at various altitudes, latitudes and longitudes.

Van Allen indicated that in practice the number of observed intersections from which significant data were obtained was much less than four per orbit due to a variety of reasons (i.e. low altitude, shell tilt, excessive radio range, points of relatively high background radiation).



Supplementing the use of *Explorer IV* for observing the *Argus* effects, the Air Force Special Weapons Center participated with Project *Jason*. This consisted of firing a series of five-stage solid-propellant, high-altitude sounding rockets from three primary sites: Cape Canaveral, Wallops Island, Va., and Ramey AFB, Puerto Rico. To measure background radiation prior to *Argus*, a preliminary firing from Patrick AFB was accomplished on Aug. 15, 1958.

• **High success**—Thirteen successful firings were accomplished in all (out of 19) during the *Argus* effort. Each delivered a 50-lb. payload to an average 550-mile height. Instrumentation consisted of eight Geiger counters employing varying shielding and different degrees of collimation (to observe

TABLE I. Summary of Detector Characteristics
(Explorer IV)

CHANNEL	DETECTOR	SHIELDING	SENSITIVE TO:	GEOMETRIC FACTOR
1	Geiger-Mueller counter (Anton 302); cylinder approximately 7mm x 9mm	1.2 g/cm² Fe + 1.6 g/cm² Pb (minimum)	Electrons of E > 5 Mev; Protons of E > 40 Mev; X-rays of E > 80 kev; with low efficiency	Omnidirectional geometric factor 0.14 cm² for min. stopping power; 0.82 cm² for penetrability 7 g/cm²
2	Plastic scintillator 0.76 cm dia., 0.18 cm thick; pulse detector	0.14 g/cm² of aluminium over window	Electron of E > 580 kev; Protons of E > 10 Mev. Axis to detector ⊥ to payload axis	0.040 cm² steradian for min. stopping power; 4.2 cm² steradian for penetrability > 5 g/cm²
3	Same as Channel 1 except less shielding	1.2 g/cm² Fe (minimum)	Electrons of E > 3 Mev. Protons of E > 30 Mev. X-ray of E > 20 kev with low efficiency	Omnidirectional geometric factor 0.14 cm² for min. stopping power; 0.70 cm² for stopping power > 5 g/cm²
4	Cesium-iodide Crystal 0.76 cm dia., 0.20 cm thick; total energy-d.c. electrometer	1.0 mg/cm² of nickel and aluminum over window	Electrons of E > 20 kev; Protons of E > 400 kev; X-rays Axis to detector ⊥ to payload axis	0.0235 cm² steradian for min. stopping power; 4.4 cm² steradian for penetrability > 5 g/cm²

MinIRcooler developed by ADL. Available from Hamilton Standard for IR applications. High altitude glove by David Clark Co., Inc., courtesy of U. S. Air Force.

The ADL MINIRCOOLER

maintains IR detectors down to –350°F

Detection of very long wave length infrared or extremely small temperature differentials requires that IR cells be cooled to cryogenic temperatures. The ADL MinIRcooler provides closed-cycle refrigeration to –350°F. in a miniaturized, low-pressure (300 psia), lightweight system of high reliability —

— the only moving part below ambient temperature is a tiny plastic piston!

Hamilton Standard Division, United Aircraft Corp., has been licensed exclusively for manufacture and sale of the MinIRcooler for IR applications above –405°F.

ADL is now developing similar devices for spot cooling at temperatures down to –420°F.

See the ADL MinIRcooler in the ADL Display at the National Space Age Industry Show, Washington, D. C., May 25-29.

ngular distribution of electron flux). Telemetry gear was also included. The package was designed and constructed by Lockheed Missiles and Space Division.

In a cooperative effort by AF Cambridge Research Center and Stanford Research Institute, an additional program was instituted for observing side effects of *Argus*. Artificial aurora, radio propagation characteristics in the VLF range, and ionospheric absorption all were observed and analyzed.

The observation of auroral ionization was performed using two radar equipments (backscatter sounders) operating at a frequency near 27 mc. One was installed on the U.S.S. Albemarle, operating south of the Azores; the other on a U.S. Navy vessel (not identified) near the detonation area.

For the VLF observations, several locations were used employing a broadband receiver, loop antenna, magnetic tape recorder, and associated calibration equipment. Each setup was similar to the whistler recorders used in the IGY program. Signals from radio stations GBZ-England (19.6 kc), NPG-Seattle (18.6 kc), and NDT-Japan (17.1 kc) were analyzed for variations in signal strength.

Three IGY riometer stations, on frequencies near 30, 60, and 120 mc, were used to measure ionospheric absorption in the higher frequency band. The antennas were vertically-directed, three-element, Yagi arrays of approximately 60° half-power beamwidth.

• **Results**—In all, the *Explorer IV* made 162 passes through the radiation shell during which significant data were obtained. The three radiation shells were determined to be from 70 to 220 km thick at the low altitude of observation. Also, Van Allen observed that the *Argus* shells occurred within the "slot" between the two natural radiation zones, probably because atmospheric density is anomalously high there.

This radiation-free zone may have been explained in a recent paper by Dr. Alexander J. Dessler, a scientist of the Lockheed Missiles and Space Division. A weak spot in the earth's magnetic field known as the "Capetown Anomaly" is approximately 1000 miles long by 300 miles wide. Dessler theorized that radiation particles, reflected back and forth in the magnetic field, fall into this area and are absorbed by the atmosphere below. Radiation in this area is 1/30 the intensity of the lower Van Allen radiation belt.

Although the exact cause of the radiation decay has not been deter-

high-energy fuel briefs from Callery

Plenty of HiCal® by August 1, for authorized users—HiCal high-energy fuel production will run well ahead of immediate military test program requirements for the next few months. So Callery will have substantial quantities of HiCal-3 available for authorized users about August 1. If you have been waiting to test HiCal-3 in engines or components, write now for specific information. *New HiCal-3 Handling Bulletin is available on request.*

Lower-cost Diborane from Callery—Production quantities of Diborane are available from Callery at recently reduced prices. Investigations now under way on new process economies will mean even lower prices in the near future.

NASA awards contract to Callery for rocket propellant study—NASA has just announced the Government's first major contract award to Callery Chemical Company for research and development work in the field of rocket propellants. The NASA contract is to determine feasibility of a radically new propellant system.

New HiCal-3 fire-fighting film available for loan—This film shows the relative ease and safety with which a stable mechanical foam blanket can be established over burning HiCal liquid.

Handling of pyrophoric fuels—A new bulletin summarizes safe-handling practices for Triethylborane and Tri-*n*-butylborane. Also available: a 15-minute Triethylborane-Tri-*n*-butylborane fire-fighting film.

R & D on fuels and propellants —Callery's credentials in this demanding field record over ten years of successful studies in fuels and propellants. A limited number of new projects can be handled by Callery now in the area of fuels and propellants, component testing, inorganic and organometallic chemistry. Your inquiry is invited.

Callery to open new office in Los Angeles—Sometime in June, fuel and propellant users in the Los Angeles area can contact Callery's Dr. R. G. Brault, Market Development Engineer, for helpful technical service. Dr. Brault formerly was coordinator of high-energy fuel projects in Callery's R & D program.

For information or loan of films, write to Defense Products Dept., Callery Chemical Company, 9600 Perry Highway, Pittsburgh 37, Pa.

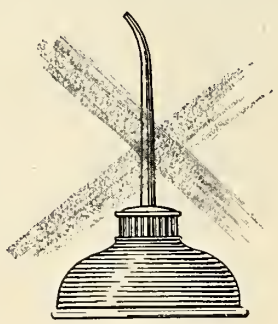
BENDIX FLEXIBLE POWER DRIVE SHAFT SOLVES MISALIGNMENT PROBLEM

POSSIBLE IN-USE DEFLECTION *of a Model 19E29-3 Flexible Drive Shaft. This standard 20-inch-long unit weighs 12 pounds, is rated 42.5 h.p. at 2800 RPM to 11,000 RPM, and includes a torque limiting clutch.*



Transmission of power to accessories mounted remotely from aircraft engines is no problem when one of Bendix Utica's flexible drive shafts is used.

High speeds are possible . . . because of symmetrical shaft design. Two constant velocity ratio flexible joints, made up of high alloy steel diaphragms, permit up to plus or minus 10° intermittent deflection and plus or minus 5° continuous deflection while maintaining rotational balance in the shaft at any speed.

High operating temperatures won't affect efficiency of a Bendix Utica shaft. Unique joint design permits continual operation at maximum speed, at any temperature up to 600° F.

We can solve virtually any power take-off problem using one of our standard or special design flexible shafts. Special designs can be engineered for unusual applications involving almost any degree of misalignment and power/speed requirements. A mechanical disconnect can be provided integral with the shaft to disconnect driven accessories from the driving source.

We've gained wide experience in successfully solving all kinds of intricate drive shaft problems. No matter what your aircraft power transmission problem, you'll get the best answer to it from Bendix Utica.

NO LUBRICATION NECESSARY

NO LUBRICATION *is required for flexible torque carrying members. The flexing diaphragms transmit load, with no rubbing or sliding surfaces. They generate no frictional wear and little heat, resulting in long shaft service life.*

mined, it is however, a composite of both atmospheric and magnetic effects, he said. "A very rapid drop in intensity of *Argus I* and *Argus II* on Sept. 4 suggests that the great solar magnetic storm of that date may have caused a greatly enhanced rate of loss of stored particles."

The attempt by Project *Jason* to observe the electron shell produced by *Argus I* was not entirely successful, although some data was obtained. Following *Argus II*, a total of ten rockets were fired successfully and much information was obtained. The rockets penetrated the shell at an altitude of 200 to 300 miles. A region of very high radiation was observed to be about 12 miles thick, although increases in radiation levels were observed 400 miles to either side. Both the width and location of the shell remained constant (plus or minus five miles) for the period of observation which was 100 hours. This extreme constancy, considering the fact that electrons traveled from north to south more than a million times or drifted around the world more than one hundred times, verified hypotheses as to the earth's magnetic field and the character of space as far out as one earth's radius. Also, a narrow region of intense counting rate was observed, initially 100,000 times normal.

Analysis of the data indicated the intensity of the shells decayed approximately inversely as the time from the burst. This is consistent with the theory that the electrons are predominantly lost through scattering in the atmosphere near the mirror points.

According to the Air Force, the angular distribution of the flux was measured and the electron flux was observed to be confined to a plane within the resolution of the counters (plus or minus 15°). Rocket orientation was determined by analyzing telemetry signal strength records; it was thereby determined that the plane of the flux was perpendicular to the magnetic field lines (plus or minus 5°). This measurement confirmed the supposition that the electrons were trapped. The energy spectrum was measured and found to be deficient in high-energy electrons when compared to a fission beta spectrum.

Auroral radar echoes were obtained on all three explosions by radar near the launch end and on Events I and III by the radar near the Azores. Negactive results on the Albermarle's radar for Event II were probably caused by unfavorable location of the ship. The echoes appeared within seconds after the explosion at the launch radar, and

How To Specify Ground Communications For a Missile Base

First, consider the supplier's experience and reputation. DuKane Corporation, pioneer in electronic communication systems, has installed ground communication equipment on such bases as White Sands, Patrick AFB, and Fort Churchill . . . *Second*, get help from an expert. DuKane's engineers are ready to help you. They've had wide experience in all phases of communications, including giving direct help to architects and consulting engineers in designing systems to meet any combination of needs . . . *Third*, consider equipment and flexibility. Of all the manufacturers of voice communication equipment, only DuKane offers a truly complete selection: intercom, public address, paging, background music, private automatic telephone, wireless paging for key personnel, emergency and evacuation systems, and hospital communication systems—in any combination to form an integrated system of any size, a few stations to hundreds.

For missile base ground communications, come to the experts . . . Write or wire DuKane Corporation, Dept. MR-2, St. Charles, Illinois. If you specify electronic equipment, ask also for DuKane's chart of electronic equipment symbols.

DuKane CORPORATION

Zippered nose cone cover foils moisture, dust, abrasion

To protect the polished finish of missile nose cones from assembly to countdown, B. F. Goodrich fabricated unique zippered "all-weather" Nose Cone Covers for Avco's Research and Advanced Development Division.

Made from neoprene coated nylon fabric, this shipping cover has non-rigid neoprene ribs and spacers that keep it from riding down on the cone. Special B. F. Goodrich Pressure Sealing Zippers provide easy access and removal—yet seal positively against dust, dirt, grime, damaging impact.

B. F. Goodrich was asked to engineer this special project because of its widely-known ability to manufacture coated fabrics to any shape or size—as in aircraft baggage panels. In addition, the space-saving B. F. Goodrich Zipper—used widely for air ducts, inspection ports, access doors, and aileron gap seals—withstands any pressure up to the maximum strength of the zipper itself. And it, too, can be fitted to complex contours.

Tricky sealing problems like this one are just part of the day's work at B. F. Goodrich. Next time you have such a problem and need an answer—fast—write or call *B. F. Goodrich Aviation Products, a division of The B. F. Goodrich Company, Dept. MR-59, Akron, Ohio.*

B.F.Goodrich ***aviation products***

somewhat later, although less than a minute, at the conjugate region radar. Echoes were observed in one case for one hour and fifteen minutes at the conjugate region radar, and in one case for five hours at the launch region radar.

The radar echoes moved outwards in range, and although initially there was a single well-defined echo, at some stages in the echo development more than one trace was visible, and the echo at times became widely spread in range. It is believed probable that part of the time a sporadic ionization patch existed, producing "ground-scatter" echoes; however, it is believed that most observed echoes were directly back-scattered from field aligned irregularities.

A combination of visual auroral observations and the radar records permitted the location of the conjugate magnetic point to be determined; this measured conjugate point agreed with theoretical expectations to within about 100 km.

• **Signal changes**—VLF recordings of GBZ in England taken in the Azores and in Spain showed abrupt decreases in signal strength, following *Argus II* and *III*, amounting to from 6 db to 12 db. At Stanford, signals from NPG in Seattle and NDT in Japan were analyzed for Events II and III. Both showed slight increases in signal strength for some minutes following the explosions.

A possible explanation for these observations is that the electrons scattered from the *Argus* shell (and near the conjugate area the ionized debris) changed the ionization in the lower ionosphere, apparently penetrating to low heights near the conjugate area and producing absorption.

All riometer units operated satisfactorily during the experiments, but results were negative in the sense that no significant absorption increases were recorded following the *Argus* effort. The measurements demonstrated that although there was sufficient perturbation of the ionosphere to produce reduced signal strength or absorption of VLF signals, the perturbations were either not large enough or not widespread enough to be detectable on equipment sensitive to absorption in the high-frequency range.

As a result of the satellite particle-counting experiments in the *Argus* effort and comparison of electron density in the trapped electron shells with counting rates in the Van Allen belts, it is now believed that the level of synchrotron noise from the *Argus* experiments should have been below the

DIT-MCO Is Faster and More Reliable Than Other Methods

Toke tape reod-out tests, for exomple. This method requires extro mochines to tronslote test informotion or o genius to remember the code used on the tope. Either woy, it's o costly process. Compare this to the DIT-MCO Automotic Circuit Anolyzer ond its exclusive Motrix Chort.

The DIT-MCO Circuit Anolyzer performs the entire test itself. There's no need for complex mochines to tronslote test informotion. All doto concerning errors, circuit numbers, type of flows, etc., oppeors on the Motrix Chort, so there's no need for complicoted wiring diogroms or chorts! And, the DIT-MCO Circuit Anolyzer checks one circuit ogoinst oll others . . . over 2,000 in obout three minutes . . . with occurocy never before possible in ony test system.

Some testers ore o moze of colored, floshing lights. Operotors of such test mochines must refer to 100, 500 or even 1,000 minioture lights to try ond locote errors. Chorts ond diogroms must olso be used . . . with o resultont high number of humon errors.

The DIT-MCO Circuit Anolyzer injects humon decision into every test but in such o woy thot chonces of humon errors ore nil. The eosy-to-reod Motrix Chort employs only two lights to quickly pinpoint every circuitry flow. Yet, onyone, with less thon one hour's instruction, con operote the DIT-MCO Automotic Circuit Anolyzer ond perform test functions once thought impossible!

These ore just o few reosons why DIT-MCO is foster ond more relioble thon other methods in electricol circuitry tests. Why not get the complete story? Write todoy for free Motrix Chort booklet.

New steels are born at Armco

17-4 PH
Armco 17-7 PH Stainless Steels
PH 15-7 Mo
HELP INSURE RELIABILITY

Armco's Precipitation-Hardening Stainless Steels help insure production of reliable missile components because they possess a unique combination of properties.

Armco's space-age metals provide—

High strength-weight ratios

Minimum tensile yield strengths in the heat treated condition:
Armco 17-4 PH (H 900)—170,000 psi
Armco 17-7 PH (RH 950)—190,000 psi
Armco PH 15-7 Mo (RH 950)—200,000 psi

Good corrosion resistance

Superior to the standard hardenable stainless steels, eliminates the weight and cost of surface protection.

Excellent fabricating characteristics

Easily formed in the annealed condition on standard equipment, weldable, and heat treatment is simple. Economical producibility means more hardware per dollar.

Available in all forms

Commercially produced in the form of sheets, strip, foil, plates, bars, wire, and billets. Can be forged or cast.

Use the advantages of these reliability-insuring Armco Stainless Steels in the missile components you produce. Their performance has been proved in a wide range of parts for all types of missiles. Write Armco Steel Corporation, 1969 Curtis Street, Middletown, Ohio, for complete data on properties and fabrication.

detectable level. The riometer experiments during *Argus* provide confirmation that the noise level was in fact below the level of conventional cosmic noise radiometers even in the 30-mc frequency range. No detectable increases in noise levels were observed on the riometers which were operated in the *Argus* experiments.

• **Further analyses and tests**—Data received from the *Argus* experiments are not completely analyzed, but Van Allen said the work will continue at the S.U.I. Data Reduction Center. All of the theories postulated by Christofilos appear to have been verified in the experiment. Based on the almost unqualified success of the *Argus* project, Christofilos said that repeated tests of this kind are needed to obtain more data on the earth's magnetic field, the polar aurora borealis, and many other geophysical phenomena. It already has been useful interpreting the Van Allen belt, he said.

Christofilos emphasized the harmlessness of using small A-bombs in space with respect to creating a radiation hazard to manned space travel. But he warned that bombs of megaton strength would create a radiation menace of lethal dosage (400 roentgens) to a satellite-borne man within 3 hours.

New High-Temperature Carbon Theory Formed

BERKELEY, CALIF.—Scientists at the University of California have formed a corrected theory of the behavior of carbon at extremely high temperatures. The data is considered highly useful in the operation of nuclear reactors and may have a bearing on operation of nuclear rocket engines.

According to Dr. Kenneth S. Pitzer, Dean of the College of Chemistry at U.C., present nuclear reactors have not been operated at temperatures and efficiencies allowed by the graphite structural components. This is laid to the lack of knowledge concerning the temperature ceilings of graphite.

Previously, it was assumed that when carbon is heated to temperatures high enough to vaporize it, heat drives the atoms apart so that the resulting gas is composed almost entirely of single carbon atoms, with a few molecules composed of two atoms.

A theoretical study of the problem by Dr. Pitzer and Dr. Enrico Clementi —assuming that the carbon gas is in contact with and in equilibrium with solid carbon—finds that above 2000°C there should be very few single carbon atoms.

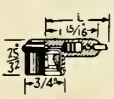
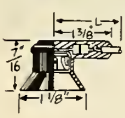
SILICONE INSULATED TUBE CAP CONNECTORS



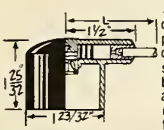
HI ALTITUDE TEMPERATURE VOLTAGE

This is a new series of Tube Cap Connectors using special silicone components for high reliability applications. They provide the highest degree of resistance to temperature extremes and are virtually unaffected by ozone and corona. The excellent dielectric characteristics make them ideal for high voltage. Skirts and sealed-in leads guard against flashover at high altitudes. Additional features include anti-corona cup and long-life spring contacts.

Clip this out—keep handy for part numbers and specs on connectors below for either ¼" or ⅜" top caps. Prefix 90 for ¼"; 91 for ⅜". Lead wire 18" long from center of cap or length to your specs.



=90 or 91SCCSL beryllium copper contact, cadmium plated nests in anti-corona cup. Silicone rubber insulation throughout.



=90 or 91SCCRSL beryllium copper contact, cadmium plated nests in anti-corona cup. Silicone rubber insulation throughout. Takes up to one watt resistor — specify value and tolerance.

=90 or 91SCCOSL beryllium copper contact, cadmium plated nests in anti-corona cup. Skirt clings to tube — guards against flash-over. Silicone rubber insulation throughout.

=90 or 91SCCORSL beryllium copper contact, cadmium plated enclosed in anti-corona cup. Skirt clings to tube — helps suppress corona—guards against arc-over. Takes up to one watt resistor. Specify value and tolerance.

=90 or 91CCSTLRL beryllium copper contact, cadmium plated nests in anti-corona cup. Glass-filled silicone insulation on cap; silicone rubber on lead. Long skirt for arc-over. Takes up to 2 watt resistor. Specify value and tolerance.

Besides new silicone types — Alden provides a complete series of connectors for ¼", ⅜" and 5/16" cap in your choice of phenolic, mica, polyethylene, nylon and Kel-F. Complete hi-voltage cable assemblies are available using Alden hi-voltage disconnects and tube cap connectors.

Some Highlights of AWA's Convention

Missile-launching nuclear airshi is Goodyear proposal; GE for ablative nose con

WASHINGTON—The General Electric Co. is putting its bets on the ablative nose cone—rather than the heat sink type—as the "best solution" for the ICBM.

The Goodyear Aircraft Corp. wants to build for the Navy a fleet of huge nuclear-powered blimps capable of launching ALBM's and fighting submarines.

These were two of the top disclosures at the Aviation Writers Association's week-long meeting that opened May 11.

• **Benefits**—H. W. Paige, GE Missile and Space Vehicle Department general manager, said GE is turning away from the heat sink nose cone because the ablative nose cone is:

- Considerably lighter.
- Less expensive.
- Not made with toxic beryllium.

The new GE RVX-2 ablative nose cone—shown publicly for the first time—weighs about one ton. The dunce-cap shaped cone is about 12 feet high and about five feet wide at the base.

ARTIST'S IDEA of the 4,500,000 cubic foot airship proposed by Goodyear.

So far it has been flown once. However, the *Atlas* that carried it from Cape Canaveral failed to travel the full 5000-mile course and the nose cone was lost in the Atlantic.

Paige said the RVX-2 succeeds the RVX-1 which has been repeatedly a *Thor-Able*.

The RVX-2 is being designed f *Atlas*. However, it may later be us on such second generation missiles *Minuteman*.

• **The nuclear blimp**—The propos missile-launching blimp would be 4.5 million cubic foot non-rigid a ship. That is about three times larg than present Navy blimps but still n as large as the huge German airshi of the 1930's.

The missile blimp would fly 10,000 feet at speeds of 70 to knots. Its range would be practical unlimited.

The 540-foot airship would made of a newly-developed dacr cloth coated with adduct synthet rubber. The cloth is highly resista to radiation.

An 86-foot control car would pr vide roomy accommodations for officers and men. It would have t decks.

• **Possible first**—The ship's gre length would make possible the placi of the nuclear reactor far enough b hind the control car to provide radiation-safe environment no mo dangerous than an atomic plant.

The blimp's turbo-prop engin also would be capable of operati on chemical fuel during taffeoffs a landings in order to avoid contamin tion. Goodyear officials said the actor would have to provide or about one-twentieth of the power quired for a plane because of t blimp's buoyancy.

Goodyear officials said they ha told the Navy they could produce operational missile airship by 1963 far sooner than experts have said nuclear-powered plane could be veloped even if the program we greatly accelerated.

Officials said the missile blimp, b sides being a missile launcher and su marine fighter, could be used as powerful early warning station.

They brushed aside possible arg ments that the huge blimp would an easy target.

"It would be extremely mobile a could carry powerful defensive wea ons," one said. "And it would harder to find than an aircraft carrie

safe/arm initiators

Ten years of pioneering in the missile component field has made possible this new line of Beckman & Whitley solenoid-operated safe/arm explosive initiators. Unit on the left has cover removed to show internal arrangement.

Weighing only 1.85 lb loaded, this model is 5 in. by 3 in. by 1¾ in. It was designed to military requirements. It can be armed or disarmed by remote electrical signal and includes both visual and electrical telemetering facilities for indication of armed or disarmed condition. On reception of a command firing signal, the unit will initiate associated primacord, low-energy detonating cord, (LEDC) or bulk charges.

This may be just what you need. On the other hand, Beckman & Whitley can provide the engineering capability, the production facilities, and perhaps most important, the speed necessary to give you anything you *do* need in the line of propellant-actuated devices.

Just tell us your problem.

high temperature
PLASTICS

Continuing research in the field of high temperature plastic molding has enabled Olympic to create fiberglass missile components such as nose cones, radomes and heat reflective shields.

High strength, heat resisting structural parts and exhaust deflectors, insulators and nozzles have been produced that perform as high as 5000° F.

Standard electrical terminal strips now adopted as NAS 1066, as well as special design terminal blocks, have been developed to withstand continuous service to 600° F.

propulsion engineering

Advantages of hybrid nuclear-chemical rocket engines are pr sented in the American Rocket Society Journal by Leon Green, Jr and James M. Carter, Aerojet-General. Chief merit of the wate light metal preheated propellant system is that it removes the pe formance limitations to which light metal fuels are restricted by hig latent heats of vaporization.

Other advantages: performance limits imposed on convention nuclear heat transfer systems by mechanical strength of the co structure are avoided by operation of the core at reduced ten peratures; problems connected with cryogenic liquids are eliminate reactor power requirements are eased by using chemical energ as a supplement.

A water-magnesium hybrid system is cited as a low-cost syste that can be built with today's materials and knowledge. Howeve Green and Carter say advanced systems, such as those using highe performance lithium, would involve additional study and would b more costly.

Pacific Engineering's new ammonium perchlorate semiworks Henderson, Nev., is using a new type of electrolytic cell. The pla has been operating "quite well" for about five months, but only no does Pacific Engineering President Fred Gibson talk about the cos cutting cell. It features a nonmetallic anode that avoids use platinum. However, he won't say what it is, only that the cell "appreciably more efficient" than the usual cells.

Puzzled by cermets? Here's a thumbnail rundown of how, whe and where to use the carbide-base cermets—chromium, titaniun and tungsten carbide. Chromium carbides have relatively low mel ing points, high resistance to corrosion, extremely high resistance oxidation, high thermal expansion and low density. Use them f valve parts, bearings, nonmagnetic applications. Titanium carbid have very high melting points, remain quite strong at high temper tures, offer good resistance to oxidation and thermal shock. Use torch tips, hot dies and guides, gas turbine nozzle vanes. Tungste carbides nowadays usually feature enough cobalt to give them hig impact strength. They offer excellent abrasion resistance. Use the in structures, precision rolls, wire drawing dies.

Graphite nozzles are coated with carbides of titanium, zirconiu niobium, tantalum, and silicon by a new metal vapor technique d veloped at Battelle Institute. Halides (chlorides, fluorides, bromide iodides) of the metals are vaporized in a pressure-temperature ran that will not let the metal deposit on the graphite surface, but wi cause reaction of the metal with the graphite to form the met carbide. Coating rate can be controlled for uniform coating. Th developers, J. M. Blocher, Jr., and I. E. Campbell, are now at N tional Steel, Weirton, W.Va.

Stauffer Chemical and Hercules Powder will use a Ziegler proce to make pyrophoric fuels in a new joint venture. The product aluminum trialkyls and other aluminum alkyls, will be produce at the rate of only 1 million lb/yr, and will be used as intermediat in production of industrial chemicals as well as for fuels and hig altitude flame sustainers.

Look for lithium perchlorate—one of the best solid-propella oxidizers hit upon yet—to roll out of the HEF (Hooker Chemic and Foote Mineral) Columbus, Miss., ammonium perchlorate pla before many more months. The industry says commercial productio is not yet feasible because of lack of demand. But the new Columb plant was designed for easy conversion to the lithium oxidizer. An insiders say big enough demand appears on the horizon.

Allied-Kennecott Titanium Corporation has postponed plans build a large-scale Ti plant "because of excess capacity for the met due to defense cutbacks." Instead, the company will increase r search to broaden the metal's commercial uses.

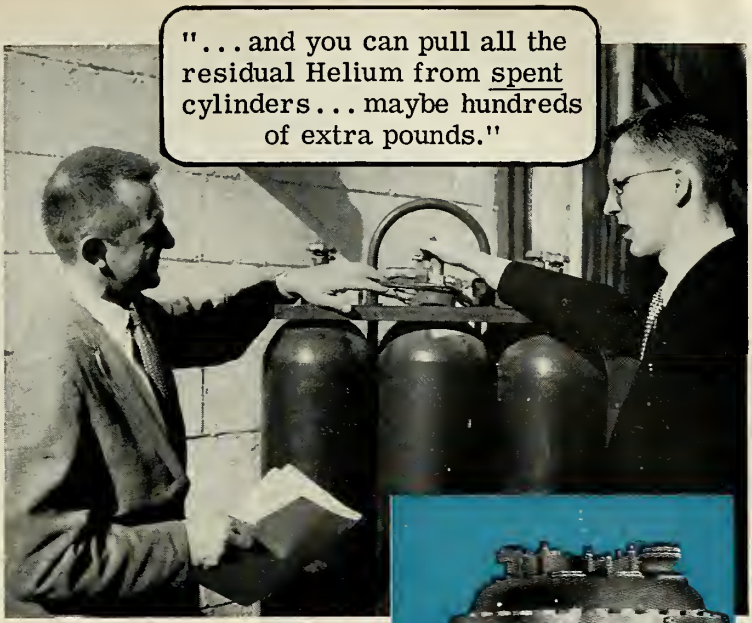
people

Appointment of **Richard E. Horner** as ociate administrator of the National ronautics and Space Administration will e administrator **T. Keith Glennan** and sistant **Hugh L. Dryden** from operanal management and allow them to ote full time to planning and policy isions. Horner's current post as Asant Air Force Secretary for Research l Development is expected to go to **I. Joseph Charyk,** chief AF scientist. e move is scheduled for June 1.

NASA has also appointed former *Vanard* director **Dr. John P. Hagen** as sant director for program coordination review and coordinate the space ncy's scientific and technical programs. e *Vanguard* staff will be intergrated o other NASA projects.

David H. Newby, space and aeronautl scientist. has been appointed represtative of NASA at the Army Ordnance ssile Command, Huntsville, Ala., where duties will include technical monitorl of NASA-funded projects.

Dr. Clifford C. Furnas, onetime Assista Secretary of Defense, R&D, has been ned vice-chairman of the Army Scieific Advisory Panel. Furnas, currently ancellor of the University of Buffalo, sceeds **Dr. James W. McRae,** who retly was named chairman. Outgoing airman **Richard S. Morse,** in turn, will sceed **Dr. William H. Martin,** retiring the Army's Director of Research and velopment.



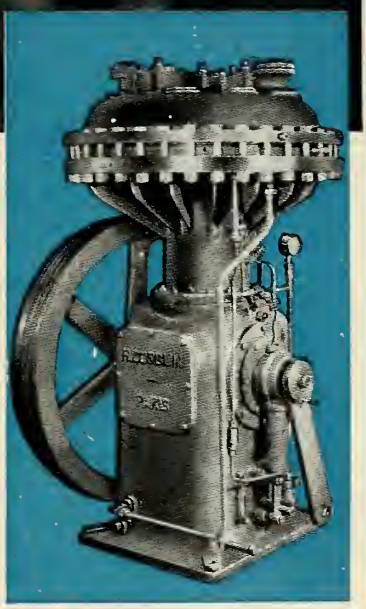
RANDALL

Frank Randall, president of Amperex Electronic Corp., has been elected vice president of North American Philips Company, Inc. Amperex is an affiliate of N. A. Philips. Randall retains his position as president of Amperex as well as vice president and direct of Ferroxcube Corp. of America, also affiliate of N. A. Philips.

Karel J. Bossart, assistant to the vice sident-engineering for Convair Divisl of General Dynamics Corporation, vs named the California Air Force Assoction's "Man of the Year in Science." ssart, "Father of the *Atlas*" intercontital ballistic missile, last year received Air Force Exceptional Civilian Service ard for his leadership in developing free world's first ICBM.

From the *Atlas* program's inception as MX 774 *Hiroc* research rocket in 46, Bossart has been intimately assoted with the *Atlas* throughout its design d development period. He served as ief engineer on the *Atlas* program and March, 1957, was promoted to techal director of Convair-Astronautics. nong the breakthroughs in rocketry deloped by Bossart and his associates in MX 774 and *Atlas* programs are the st separable nose cone, the first integral l tanks and the first swiveling engines directional rocket control.

..without contaminating the Helium!



All residual helium may be pulled from cylinders previously thought to be "spent" by using a Corblin Diaphragm Compressor.

Any number of used cylinders may be hooked together and tied to a Corblin Compressor. The unused helium is pumped out of the cylinders ... into the compressor which pressurizes the gas and pumps it into other cylinders.

A single stage compressor, because of the high compression ratio at which it works, may be used to suck all the helium (or other rare gases) from "spent" cylinders, depressurizing them down to atmospheric pressure. The gas is sucked by the compressor directly at tank pressure; there is no need to use bothersome pressure regulators to reduce pressure prior to suction.

Besides helium, Corblin Compressors may be used to pump carbon monoxide, carbon dioxide, chlorine, fluorine, ethylene, argon, oxygen, air, etc.

Send for FREE BULLETIN K-2

CORBLIN Diaphragm
COMPRESSORS

- No contact between gas and hydraulic fluid or lubricant insures freedom from contamination.
- Compressors lend themselves readily to automatic operation.
- Units operate efficiently with fluctuating input pressure, without need for pressure reducers or expansion vessels.
- Pressures available to 15,000 psi.—capacities to 60 s.c.f.m.

INFRARED FINGERPRINTS

for reconnaissance, interpretation and prediction

Aerial reconnaissance systems of the future will depend on infrared detectors and scanners for operation around the clock. Each surveillance target or object of military or geophysical significance will have its own characteristic fingerprint in the infrared spectrum.

Infrared scientists at Bendix Systems Division, backed by years of experience in these techniques, are developing important new approaches to the interpretation and prediction of infrared reconnaissance data.

Extensive flight test data are being analyzed and catalogued to provide the guide to infrared interpretation. Also, test results are being correlated with laboratory techniques to predict the response of sensors and synthesize the infrared pictures they will produce. Thus, it will be possible to plan missions exactly as they will appear to the infrared observer.

Other infrared work includes target and background radiometric studies, detector studies, and infrared instrumentation for geophysical satellites, seekers, search, track, fire control, early warning, aerial intercept, collision warning, communication, mapping, horizon sensing, and infrared augmentation for target drones. Progress in infrared research and development exemplifies Bendix leadership in "the systems of tomorrow." Major Programs include the AN/AMQ-15 Weather Reconnaissance System and the Eagle air-to-air missile system. Inquiries are invited with respect to positions for better engineers and scientists.

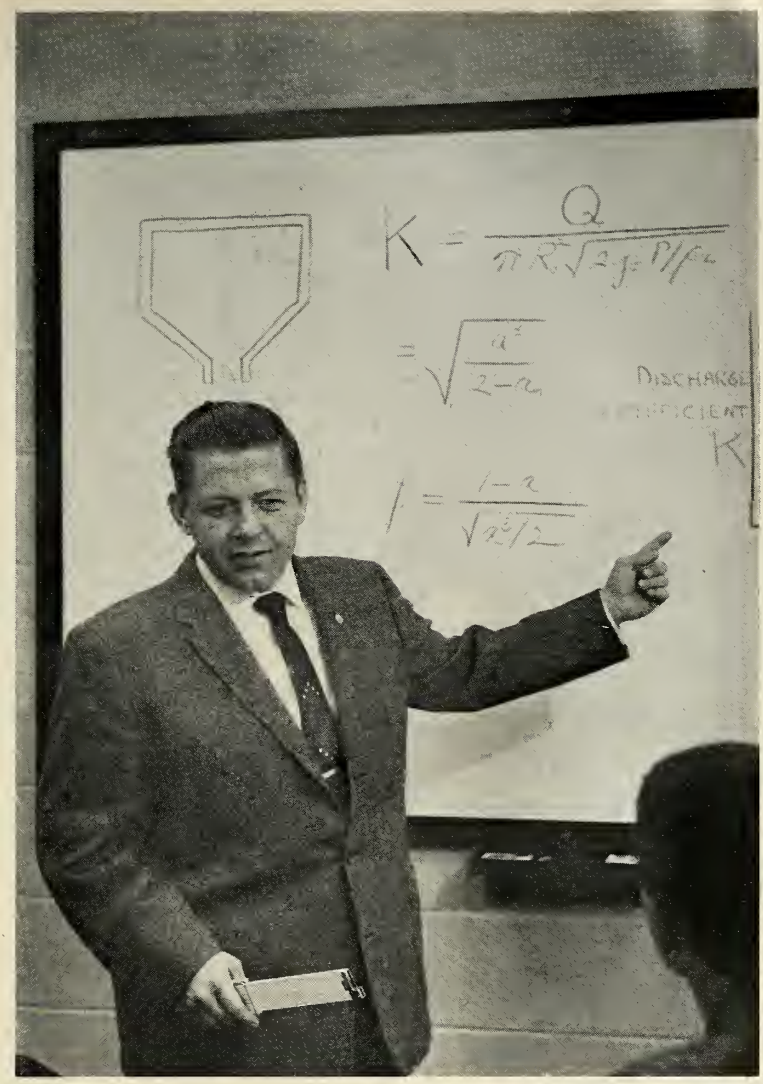
KAUFHOLD

Crosley Division, Avco Corp., has appointed **Gerard W. Kaufhold** sales manager for infrared systems. Kaufhold was formerly at Republic Aviation Corp., Farmingdale, N.Y., as research and development project administrator, and fighter plane project engineer with he Air Force Air Materiel Command.

The National Aeronautics and Space dministration and the Department of Defense have set up a joint working roup on search and recovery aspects of he Project *Mercury* manned orbital vehicle program and have named as co-hairmen of the group **Edmond C. Buck-y,** assistant NASA director for Space light Operations, and **Rear Adm. J. W. Cannon,** assistant Chief of Naval Operations (Fleet Operations).



David E. Shonerd, 37, has been appointed assistant program director for he *Minuteman* ICBM program, Space echnology Laboratories, Inc. An author f four technical papers who has three atents pending, Shonerd was formerly ith Aerophysics Development Corp., Hughes Aircraft Co., Jet Propulsion Laboratory and the Naval Ordnance Test tation at Inyokern, Calif.

Two new divisions have been set up s a result of reorganization of the engineering group at Ramo-Wooldridge division of Thompson Ramo-Wooldridge nc. The Systems Technology Division ill be headed by **T. B. Bissett,** with ernard **Berman** as associate director. **filton E. Mohr** will be acting director f Data Processing Division.

GREY

Dr. James T. Grey, recently scientific adviser to the USAF director of research and development, has been appointed director of the research planning staff, Rocket Divisions, Thiokol Chemical Corp. His responsibilities will include study of non-military or commercial applications for rockets, rocket components nd propellants. His work for USAF was mainly in fuels, combustion, propulsion, hemistry and materials.

Marvin G. Whitney has been appointed vice president in the Semi-conductor ivision, Hoffman Electronics Corp. and anager of the division's new West Coast lant. Whitney, previously a vice presilent of the company's Consumer Prodcts Division, joined Hoffman in 1953 as he division's director of engineering and anufacturing, and later served as an dministrative assistant to the president.

Here is a man you should know
he's a DELAVAN FUEL INJECTOR SPECIALIST

His name is Paul D. Burgess. He's a senior project engineer on Fuel Injector Development, specializing in injection devices for thrust augmentation and primary fuel injection. He's been with Delavan 5 years, and has designed and developed fuel injectors for use on some of the most advanced aircraft engines, scheduled for production in the near future. Men like Paul Burgess, concentrating their talents on fuel injector development, have made Delavan the world's largest nozzle specialist. They're the main reasons leading turbo-jet, rocket and APU manufacturers rely on Delavan for fuel injection problem solving.

If fluid metering and atomization are part of your product, take advantage of Delavan's specialized experience and proven ability to deliver aircraft quality. Send specifications to the address below for obligation-free recommendations.

missile tracker for china lake

Kollmorgen Missile Tracking Binoculars are an integral part of an acquisition and photography system which records tactical air-to-air missile performance at China Lake Naval Ordnance Testing Station. These binoculars, adapted from a basic Kollmorgen design, are high magnification, wide-field instruments with unusual light-gathering power. An operator is able to spot a missile-launching aircraft and track the missile from the time it is fired until it finds its target—all at extreme ranges. Among other Kollmorgen contributions to the missiles field are the bunker periscopes at Cape Canaveral.

By combining optics, mechanics and frequently electronics, Kollmorgen designs many different types of instruments and systems for industrial and defense viewing and inspection applications. A new illustrated brochure describes our design and manufacturing facilities and primary fields of interest. For your copy, write Dept. 105.

west coast industry

by Fred S. Hunter

There appear to be several good reasons why the proposed merger of Thiokol Chemical Corp. and Marquardt Aircraft Corp. would benefit both companies, their managements and their stockholders. Uppermost, however, is that the consolidated company would have systems capability. In other words, it could expand in the missile field up to and including the production of a vehicle.

Thiokol, a chemical company, has little in the way of hardware, except for its Reaction Motors division. Consolidated with Marquardt, it would have three propulsion systems, airframe capability, guidance experience, ground support equipment, test equipment—everything necessary to become a big operator in the missile picture.

The proposed merger is expected to go through to consummation with the consolidated company to be known as the Thiokol-Marquardt Corp. J. W. Crosby, now president of Thiokol, would become chairman of the board, and Roy E. Marquardt, now president of Marquardt, would become president. The top level of management probably would be expanded by two executive vice presidencies; one for supervision of the present Thiokol enterprises, the other for the present Marquardt operations.

In view of the fact that Thiokol will be the acquiring company, headquarters for the merged concern might remain in Trenton, N.J., but a more logical development could be establishment of general offices in a new location such as Salt Lake City. Thiokol's Utah division is at Brigham City, only 20 miles from Salt Lake, and Marquardt's *Bomarc* manufacturing plant is at Ogden in the same area.

Machine shops in southern California are at a low ebb because airframe volume is down, but missiles, particularly in the ground support phase, are picking up some of the slack. The Langley Corp. in San Diego, for example, had a net loss of $73,768 in 1958. But this year it will make some money, its President M. B. Laddon reports.

In the last five months Langley's level of unfilled orders has climbed from $800,000 to $1.2 million and the missile portion of the backlog has increased to about 25% currently from 10% a year ago. A further gain is anticipated. Among Langley's missile products are an assembly for a *Hawk* missile launcher and swivel joints and valves for fueling the *Atlas* ICBM. "We are looking for products, techniques and activities that will continue to take us out of the job-shop field," said Laddon in reporting his company's interest in favorable acquisitions that could broaden the base of the business.

Bidding on ICBM launching site installations seems to have become very tight. Wells Benz, Inc., a San Diego and Phoenix construction company which has done considerable of the work at Point Mugu and Point Arguello, was the low bidder at $5,314,872 for the job at Spokane, which the government had estimated would cost $8,553,000.

Louis D. Statham, president of Statham Instruments, Inc., says the operations of the company's Puerto Rico subsidiary have far exceeded "our fondest profit and production expectations," and have helped triple the size of the parent company in Los Angeles. The Statham subsidiary is soon to open a second plant on the island.

Joint test program on the Convair F-106 and its weapons subsystems is being completed at the Air Force Missile Test Center, Holloman Air Force Base. The F-106 incorporates Hughes Aircraft's new MA-1 fire control system and carries the new GAR-3 *Super Falcon*. In combat, it can carry a mixed load of *Falcons* and Douglas *Genie* air-to-air rockets.

Rear envelope of the Douglas C-133B, redesigned specially to carry the *Atlas* ICBM, opens up like an airplane hangar.

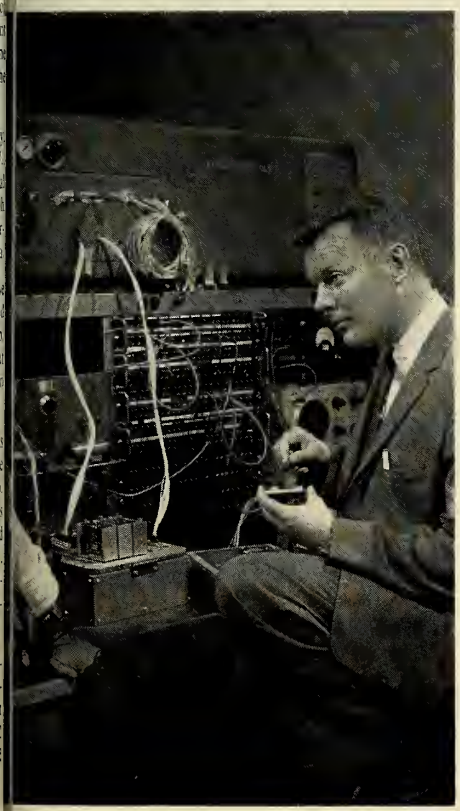
FLIGHT CONTROLS

Expanding the Frontiers of Space Technology

Flight Controls offers one of the most challenging areas of work at Lockheed's Missiles and Space Division.

From concept to operation, the Division is capable of performing each step in research, development, engineering and manufacture of complex systems. Rapid progress is being made in this field to advance the state of the art in important missile and spacecraft projects under development at Lockheed.

Flight controls programs include: analysis of flight data and sub-systems performance, design and packaging of flight control components, development of transistorized circuits, operation of specialized flight control test equipment, and fabrication of flight control prototypes. Other work deals with the design, development and testing of rate and free gyros; accelerometers; programmers; computer assemblies; guidance control systems; circuitry; and hydraulic systems and components.



In the flight controls simulation laboratory, mathematical representations of elements in a control system are replaced one by one with actual hardware to determine acceptability of specific designs. From these studies, Lockheed obtains information which is used in further refinement and improvement of final control systems designs.

Lockheed Missiles and Space Division is weapons systems manager for such major, long-term projects as the Navy Polaris FBM; Discoverer Satellite; Army Kingfisher; Air Force Q-5 and X-7; and other important research and development programs.

Scientists and engineers desiring rewarding work with a company whose programs reach far into the future are invited to write: Research and Development Staff, Dept. E2-29, 962 W. El Camino Real, Sunnyvale, California, or 7701 Woodley Avenue, Van Nuys, California. For the convenience of those living in East or Midwest, offices are maintained at Suite 745, 405 Lexington Ave., New York 17, N.Y., and at Suite 300, 840 N. Michigan Ave., Chicago 11, Ill. U.S. Citizenship required.

"The organization that contributed most in the past year to the advancement of the art of missiles and astronautics."

NATIONAL MISSILE INDUSTRY CONFERENCE AWARD

Transistorizing missile flight control systems by Lockheed scientists has meant significant reductions in weight and space requirements.

Pre-flight check-out on final assembly on X-7 missile. The X-7 holds free-world's speed and altitude records for air breathing missiles.

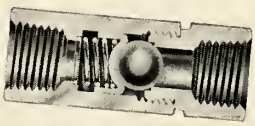
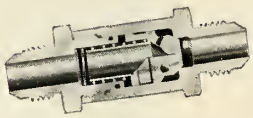
CHECKS
THAT FILL YOUR NEEDS

MINIATURE CHECKS

Mini-Valve — Regular Size Valve



Save weight and space with Mini-Valves. They have same rated flow as regular size, but are only ¼ the size and weight. Good pressure drop characteristics. Temp. range −65° to plus 400°F. Operating pressure to 5000 psi. One-piece stainless steel body, in tube sizes 4 to 16 (¼" to 1" O.D.) Meets or exceeds requirements of MS MIL-V-25675. Port threading MS33514 flareless.



FREE-FLOW CHECKS

Extremely low pressure drop, with wide open flow. Molded elastomer seal and spherical seat prevent leakage at any pressure. Sizes ⅛" to 2" in brass and aluminum alloy up to 3000 psi, and stainless steel to 4000 psi. Opens at 2 psi. Temp. range −65° to 200°F. Pipe, internal straight thread and flared tube connections standard; MS33514 flareless available.

BALL CHECKS

Ruggedly constructed for intermittent non-shock hydraulic service up to 500 psi at temperatures −65° to 350°F. Sizes ⅛" to ¾". Brass, aluminum alloy, stainless steel. Pipe and flared tube connections.

HY-PRESSURE CHECKS

Built for continuous service in high velocity systems at pressures up to 5000 psi in steel and stainless steel, and 3000 psi in aluminum alloy. Low pressure drop. Metal-to-metal seal. Operating temperatures −65° to 250°F. Sizes ⅛" to 2", with pipe, internal straight thread and flared tube connections. MS33514 flareless available.

A wide selection of the new Bristol stock ⅞" OD capsular elements is now available in pressure ranges from 15 to 350 psi.

These are the latest of Bristol's long-life, Ni Span C pressure sensing elements widely used in the aircraft and instrument fields. For applications requiring miniaturization, this new ⅞" OD is the optimum size. Nominal deviations from linearity of these precision miniatures is less than 1%.

Other Bristol stock capsular elements range from 1 5/32" to 2 11/32" OD and have a nominal deviation from linearity of less than ½% (deviation due to hysteresis of less than ¼%). Normal operating temperature range is −65° to 300° F. . . . for higher temperatures to (550°) a slight 2% travel change may be expected.

Bristol has been manufacturing pressure sensing elements for 70 years. For further information on these capsular elements with outstanding linearity characteristics write for Bulletin AV2001: Aircraft Components Division, The Bristol Company, 173 Bristol Road, Waterbury 20, Conn. e.54

,190,767—**Douglas Aircraft Co., Inc.,** for missile launching items.

723,000—**Allied Chemical Corp., General Chemical Div.,** for supporting research on high-energy oxidizers for advanced solid rocket propellants.

581,654—**Northrop Corp., Radioplane Div.,** for target missile research and development.

538,793—**Douglas Aircraft Co.,** for launching area parts and repairs.

516,625—**Olin Mathieson Chemical Corp.,** for research and development on high-energy fuels for advanced solid rocket propellants.

294,041—**Western Electric Co., Inc.,** N.Y., for *Nike* spare parts and components (four contracts).

279,106—**Western Electric Co., Inc.,** for *Nike* spare parts and components (four contracts).

100,000—**California Institute of Technology,** for research and development.

97,550—**RCA, Service Co. Div.,** Camden, N.J., for research and study of signals transmitted from satellite and space vehicles.

84,185—**Sylvania Electric Products, Inc.,** for research and study of *Nike-Zeus* acquisition radars.

81,635—**Raytheon Mfg. Co.,** for electronic assemblies for *Hawk* missile system (40% subcontract work will be available).

57,750—**North American Aviation, Inc., Rocketdyne Div.,** for design and development.

$38,663—**Barnes Engineering Co.,** Stamford, Conn., for research in measurement of re-entry bodies of missiles.

$29,724—**Gilfillan Bros. Inc.,** Los Angeles, for repair parts.

AIR FORCE

$10,000,000—**The Martin Co.,** Baltimore, for auxiliary equipment for the TM-76B *Mace.*

$850,000—**Kollsman Instrument Corp.,** Elmhurst, N.Y., for components of MD-1 automatic astro compass. Installation and spares for B-52 aircraft.

$800,000—**Marquardt Aircraft Co.,** for radar target simulators, spare parts, ground support equipment, data and service.

$500,000—**Bohanan Manufacturing Co.,** Compton, Calif., for follow-up production of force ejection systems for external stores for use on the F-101-B aircraft. (Contract awarded by McDonnell Corp.).

Our most potent weapon in the battle of time:

QRC*

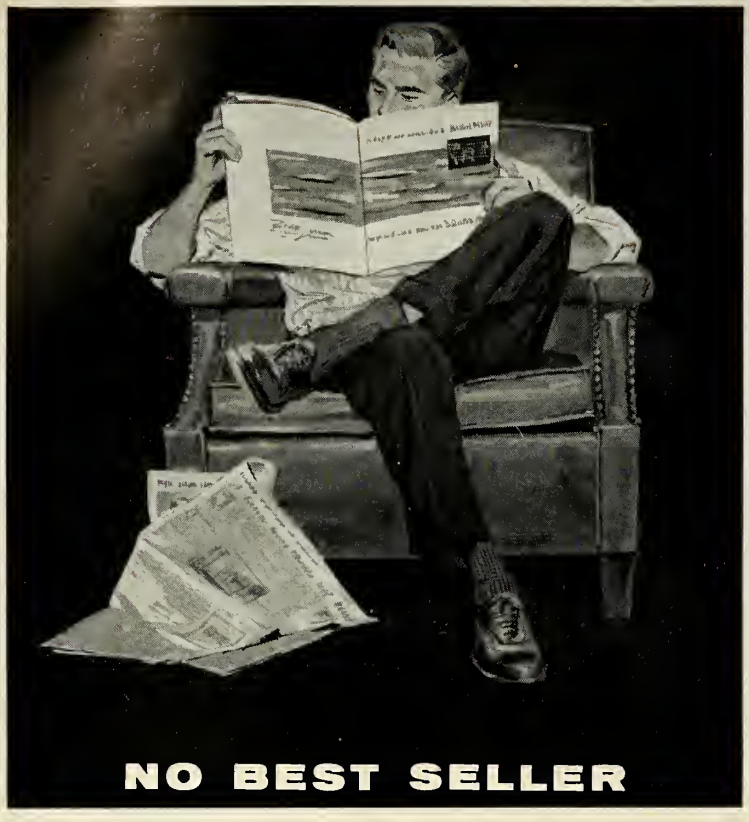
In advanced military electronics research, the ability to do the job *isn't good enough.* The job must be done *reliably* and *on time.*

Hallicrafters' QRC program was originated to provide not only the finest of engineering facilities and people, but the flexibility required for immediate, crash effort on critical electronics problems.

Hallicrafters has provided our military forces for the past six years with a Quick Reaction Capability that has played a major role in helping to win the battle against time.

* Quick Reaction Capability: Refer to Air Force Reg. No. 80-32

The tough jobs get off the ground in a hurry at . . .



hallicrafters

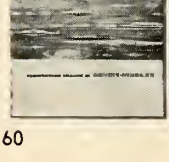
Chicago 24, Ill.

Qualified Engineers: new contracts have created openings. Contact William F. Frankart, Director of Engineering.

Circle No. 31 on Subscriber Service Card.

. . . but it may be the most significant book you've ever read

There's a whole new way of life for you between the covers of "Opportunities Abound at Bendix Missiles" —and a four-cent stamp will bring it to you by return mail. If you have the qualifications, Bendix can offer you an enviable career in the guided missiles field, working with men who have been responsible for some of the most significant missile engineering advances of recent years.



At Bendix, you will be in a major missile program. Bendix as prime contractor has responsibility for the Talos guided missile, one of our most vital defense weapons. Using the finest equipment, you'll learn fast and grow fast, both professionally and financially. There's opportunity here—opportunity to do important, stimulating work.

You'll like living in the Middle West. The climate is pleasant and Chicago, Lake Michigan and other fine recreational areas are easily accessible. There is also opportunity locally to pursue graduate engineering studies. Mail the coupon below. The book may not be a best seller, but it has been the instrument which started many a talented engineer on a fine career in engineering.

$126,000—**Hughes Aircraft Co.,** for continuation of SAGE integration program.

$78,837—**Continental Aviation & Engineering Corp.,** Detroit, for six J69-T-29 engines for Q-2C drone aircraft.

$63,800—**Raytheon Manufacturing Co., Microwave and Power Tube Div.,** for miscellaneous tubes.

$62,660—**Eagle-Picher Co., Chemical Div.,** for water-activated batteries.

$60,688—**Instrument Corp. of Florida,** for mobile shelters for mounting BC-4 cameras and other related items.

$57,910—**Columbia University,** for research in the physics and chemistry of gases at high temperatures.

$49,107—**PSP Engineering Co.,** Maywood, Calif., for solenoid-electrical.

$40,756—**University of Colorado,** for research directed toward design and development of Biaxial Pointing Controls and rocket-borne telemeter systems.

$40,009—**University of Rochester,** Rochester, N.Y., for continued research on problems of gas dynamics of cosmic scales.

$39,623—**North American Aviation,** for miscellaneous spare parts used in 2.75 Rocket Package Assembly.

$37,000—**Southwest Research Institute,** San Antonio, Tex., for additional facilities for missile lubrication research and test development.

$36,275—**University of Minnesota,** for rocket sled ballistics to be used in support of Project 7856.

$25,826—**Chromcraft Corp.,** St. Louis, for intervalometers used with launcher rocket.

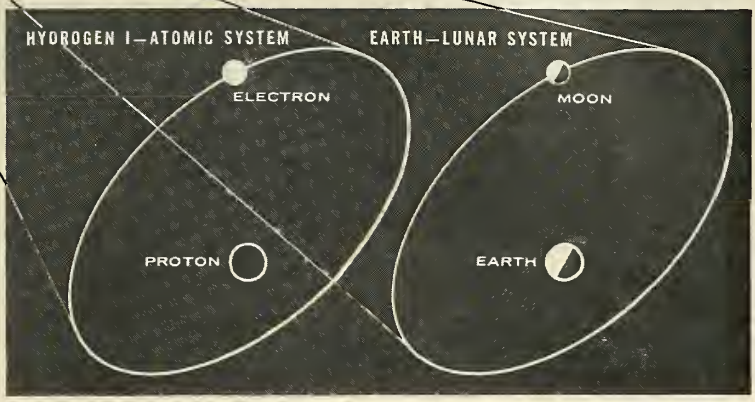
$20,554—**Swanson & Youngdale, Inc.,** Minneapolis, for construction of storage base, LOX addition Project Ellsworth.

UCLA Undertakes 3 Year Study of Free Radicals

LOS ANGELES—A three-year study of free radicals has been begun by scientists at UCLA in order to clarify the basic electronic structure of the molecule.

The work will involve use of a new technique—electron paramagnetic resonance spectroscopy—allowing measurement of the energy levels of the electrons in the radicals by varying the applied magnetic field and the frequency of the exciting electromagnetic radiation.

The research will be conducted by Dr. Daniel Kivelson, who has received a $27,400 grant from the National Science Foundation.



The free radical can be created artificially, but is rarely found in nature. Nearly all natural molecules have an even number of electrons, while the free radical contains an odd number. It is an important link in many chemical reactions, serving frequently as an intermediate between the stable, natural molecules.

ENGINEERS – SCIENTISTS

$$P(k_1, k_2, \ldots, k_m) = \frac{n!}{k_1! k_2! \ldots k_m!} p_1^{k_1} p_2^{k_2} \cdots p_m^{k_m}$$

Is order and organization in MACROCOSM and MICROCOSM an underlying principle of the universe... or does a fundamental state of randomness prevail in the cosmos as might be expressed by the multinomial formula at left?

BOLD MINDS

THROUGHOUT HISTORY..... BOLD MINDS have sought to understand the forces at work in the universe, and as they developed working hypotheses, endeavored to turn all knowledge to their own purposes, devising philosophical and mechanical systems of their own.

As old hypotheses become inadequate or untenable, thinking men devise new ones. So the concept of a "flat" world has changed to an oblate orbiting spheroid—mere speck in a vast and expanding universe; so "empty" formless space is regarded as a curved continuum occupied by random knots of turbulence (creating the new branch of mechanics—hydromagnetics).

Today new horizons of discovery and surmise arise before the speculative mind.

ENGINEERS AND SCIENTISTS AT REPUBLIC FEEL KINSHIP WITH ALL BOLD MINDS OF PAST AND PRESENT. AS THEY FACE THE EXHILARATING CHALLENGES OF CREATING VEHICLES TO FLY IN ENVIRONMENTS WHERE NEW APPROACHES IN THERMO/AERODYNAMICS MUST BE MADE...AS WELL AS APPROPRIATE PROPULSION AND ELECTRONIC SYSTEMS TO POWER AND GUIDE TRANSIT IN SPACE

Groups of Research, Development and Experimental Engineers and Scientists at Republic Aviation are now working on projects over the whole range of aeronautics and astronautics—from supersonic and hypersonic weapons systems, both manned and unmanned, to plasma propulsion and space electronics.

Imaginative professional men at many levels of experience are invited to inquire about opportunities indicated below:

ELECTRONICS
- Inertial Guidance & Navigation
- Digital Computer Development
- Systems Engineering
- Information Theory
- Telemetry-SSB Technique
- Doppler Radar
- Countermeasures
- Radome & Antenna Design
- Microwave Circuitry & Components
- Receiver & Transmitter Design
- Airborne Navigational Systems
- Jamming & Anti-Jamming
- Miniaturization-Transistorization
- Ranging Systems
- Propagation Studies
- Ground Support Equipment

THERMO, AERODYNAMICS
- Theoretical Gasdynamics
- Hyper-Velocity Studies
- Astronautics Precision Trajectories
- Airplane/Missile Performance
- Air Load and Aeroelasticity
- Stability and Controls
- Flutter & Vibration
- Vehicle Dynamics & System Designs
- High Altitude Atmosphere Physics
- Re-entry Heat Transfer
- Hydromagnetics
- Ground Support Equipment

PLASMA PROPULSION
- Plasma Physics
- Gaseous Electronics
- Hypersonics and Shock Phenomena
- Hydromagnetics
- Physical Chemistry
- Combustion and Detonation
- Instrumentation
- High Power Pulse Electronics

NUCLEAR PROPULSION & RADIATION PHENOMENA
- Nuclear Weapons Effects
- Radiation Environment in Space
- Nuclear Power & Propulsion Applications
- Nuclear Radiation Laboratories

A new $14,000,000 Research Center—to be completed this year—is part of Republic's far-ranging R&D programs aimed at major state-of-the-art breakthroughs in every flight regime & environment.

NEW PRODUCT BRIEFS

RIOPLASTIC POLYMER. The lment of a new acrylic-type thero- ti polymer possessing high heat re- n and an exceptional combination tiness and toughness has been an- ed by the J. T. Baker Co. The i designated by the code #PL-12, heat distortion point of 240°F, ral modulus of 415,000 psi and a th izod impact strength of 1.0 ft. rt. Injection molding and extrusion L2 can be carried out by conven- a acrylic techniques.

lo. 240 on Subscriber Service Card.

G: SWITCH. A magnetic emplifier Es for the first time the relia- y of all-static construction and the it to perform logical switching tns. The small unit serves as an r, or not gate, or as a bi-stable ny device. Designer and manufac- rs Pacific Magnetic Corp. Called MC-785 logic type magnetic am- e the unit is made primarily for il control and check-out applica- s. it replaces three relays in logical cng epplications and is suited for i pressure and temperature detec- nd control infrared detection, ntion, servomechanisms, computer es and in other logic epplications. vstands extremes of shock, vibra- nd temperature, has no moving srequires no servicing, and has un- te shelf and use life. The unit has e input control windings, a bias dg and two gate windings. It op- e from a 70V center-tapped trans- n on a 115V line at 400 cps, has r response, and accepts a minimum signal of only 2 millwatts. Nominal p is 28 VDC at 10 watts. The com- e is fully encapsulated and op- te over a temperature range of 0 to 100°C. Dimensions: 2" x x 1¼". Weight: 10 oz.

lo. 241 on Subscriber Service Card.

NAKE SYNCROS. Luther Manu- ng Co. has announced aveilability h-accuracy pancake synchros and l rs. These synchros end resolvers esigned and manufactured for inertial guidance systems where a pan- cake configuration is necessary for space and weight limitations. These units are available in size 20 to size 27, featuring accuracies down to 5 minutes. Their electrical properties are designed to match standard com- ponents for accuracy, voltage gradient and impedances. They can be obtained with flanges and hubs as an integral part for ease of installation and adjust- ment.

Circle No. 242 on Subscriber Service Card.

CONTROL VALVES. A two-way valve which allows independently-controlled flow in either or both directions is an- nounced by True-Flo Valve Co. Avail- able in standard IPS from ⅛" to ¾", the units are adaptable to hydraulic or pneumatic applications in pressures as high as 5000 psi. The valves are female- threaded to dryseal specifications and ere available in brass, steel, aluminum, stainless, end special alloys. Extreme dependability, lower friction loss, and greater flow at ell temperatures are claimed due to design which eliminates internal gaskets, springs, or hinged parts.

Circle No. 243 on Subscriber Service Card.

TIMING GOVERNOR. A universal tim- ing governor, designed for application to a variety of timing devices, is now being offered by Precision Products Inc. The governor features e patented self- starting movement housed in a stainless steel case with a transparent tamper- proof cover. It is easy to attach to an associated device end easily removed for servicing. A small connecting drive pin mey be used to connect working mechanism to power supply.

Circle No. 244 on Subscriber Service Card.

TITANIUM HOOKS. Titanium anode hooks and baskets, with high corrosion- resistant qualities, have been developed for the plating industry by Mellory- Sharon Metals Corp. Both hooks and baskets are aveilable in standard sizes and shapes. Standard titanium hooks range in size from 3½" to 8", with special sizes on request Fabriceted from pure titanium, the hooks and baskets are said to have an indefinite life in highly corrosive mixtures.

MISSILE LITERATURE

MERCURY SWITCHES. Newly-revised Catalog 90b describes the standard line of Honeywell mercury switches, manufactured by Micro Switch, a Division of Minneapolis-Honeywell Regulator Company. Included are photographs, dimensions, electrical ratings, drawings, application information and complete technical data.

Circle No. 206 on Subscriber Service Card.

MISSILE LEXICON. A new book, Missiles From Concept to Countdown, just published by the Aircraft Industries Association, puts into proper perspective the relationship of the missile to the Nation's arsenal; the complexities of its manufacture; the reasons for its cost; and its potential both in war and for peace. This primer has been prepared in response to thousands of inquiries from throughout the Nation for information concerning this newest form of automatic weaponry manufactured by the United States aircraft industry, and the rapidly expanding developments and achievements in the field of space exploration.

Circle No. 207 on Subscriber Service Card.

MAGNET WIRE. High-temperature ceramic insulated magnet wire for service up to 1000°F. is the subject of a new 8-page brochure just issued by Secon Metals Corporation of White Plains, N.Y. It contains the basic information on the original research performed approximately one year ago as well as the engineering data which was compiled during the past year.

Circle No. 208 on Subscriber Service Card.

BRAZING. A single-page 8½ x 11 two-color engineering data sheet discussing Nicrobrax Vapo-Flux, which produces wetting and flow of brazing alloys in marginal or poor dry hydrogen atmospheres, is now available from Stainless Processing Division, Wall Colmonoy Corp. Included in the engineering data sheet are properties, uses and methods of applying Vapo-Flux to aid in brazing in pure hydrogen or inert atmospheres.

Circle No. 200 on Subscriber Service Card.

LOCKNUTS. Locknuts combing high strength with lightweight for use in missile and related applications at temperatures up to 1200°F are described in a new bulletin offered by Standard Pressed Steel Co. Suitable for use on present MS9033 bolts as well as on stronger fasteners now being developed, the one-piece, all metal featherweight locknuts—designated FN1216 series—are rated at minimum tensile strengths of 160,000 pounds per square inch at room temperature, and more than 140,000 psi at 1200°F. Photos, design drawings and charts supplement text in the four-page illustrated bulletin in pointing up configuration and principal design features. These include overall height than present high-beam type nuts, reduced across-flats dimension of the 12-point wrenching drive and smaller outside dimensions. These permit use of shorter companion bolts and installation of nuts closer to bulkheads, saving space.

Circle No. 201 on Subscriber Service Card.

COMPUTERS. Publication of a new textbook on the basic principles, language and characteristics of electronic puters was announced by the RCA ice Co., a division of Radio Cor America. The 114-page book, en "The Language and Symbology of tal Computer Systems," explains of the basic characteristics of puters. It discusses Boolean algeb practical terms, and contains a reference of logic diagrams and sy used by various computer manufac and a dictionary of computer t nology. "In the digital computer the language is a combination of bols and words which, unfortun vary among different manufacturer users," D. H. Kunsman, President c RCA Service Co. said. "This boo fords a common index of that lan for the many engineering as well as engineering people, who must work or provide services for a com group."

NEW ENGINEERING IMPROVEMENTS THROUGHOUT!

- Faster slewing speeds— Pen: 30"/sec.; Carriage: 30"/sec.
- Greater accuracies— Static: 0.1%; Dynamic: 0.2%.
- 0.05% internal calibration.
- High precision internal Zener diode reference.
- New improved vacuum hold-down system.
- Vernier control between ranges.
- Input function modules in rack mountable case can be removed from plotter for remote operation.
- Calibrated scales on both axes.
- Front panel gain control.
- Vacuum release on front panel.
- Visible ink supply.

One basic plotter with input modules available for general-purpose, computer, low level differential, time base, curve following and other specialized functions.

miniature tape recorder

ACTUAL SIZE

newest new product from Inet!

Testing under severe environments . . . in extremely limited space? Inet's rugged new Miniature Tape Recorder simultaneously records data on 1 to 14 in-line channels, never loses a record because it's built to survive high impacts.

Here are the features to look for: precision in-line recording head; adjustable motor speed and tape tension; molded rubber pressure roller and driver wheels; and precision ball bearings at both ends to support all revolving parts.

Weighs just 24 ounces and operates at tape speeds of from ¼ to 15 inches per second in a temperature range of —50°F. to +200°F. Among its applications: in-flight and static tests; atmospheric, blast, explosion, and wind tunnel studies; and acceleration and actuation tests. *Write today for complete specifications.*

Prime contractors looking for major subcontract capability in missiles, rocket engines, ordnance, or electronics will find it at Rheem. With more than 600,000 square feet at Downey, California, the Rheem Defense and Technical Products Division offers a unique combination of experience and facilities that is unmatched in the West.

If you require unusual skills in critical welding or machining operations, be sure to consult Rheem. Rheem will assume the complete responsibility for system, subsystem, or component production, from engineering through manufacturing . . . whatever best suits your requirements. You will be impressed by the "package contract" capability that is available to you.

For the full details on Rheem availability for subcontract assignment, write to Dept. MR-712-2.

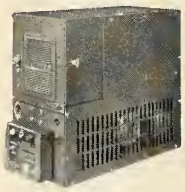
HEAT in military applications



HUNTER SPACE and PERSONNEL HEATERS

for mobile and portable shelters

Hunter Heaters are designed and manufactured in conformity with military specifications for space, equipment and personnel heating in ground support systems for missiles, radar, microwave, monitoring centers, etc. Five basic Hunter models are available currently, some multi-fuel-burning, others which burn any type gasoline, each custom-engineered to specific requirements for the area of end use. Model range is from 15,000 to 60,000 BTU/Hour output, all air-circulating, all thermostatically controlled, all designed for cold starts as low as —65°F. One of the current models is . . .

MODEL UH-68

Produced in conformity with military specification MIL-H 11511B • 60,000 BTU/Hr. output • multi-fuel burning • designated "spec" equipment in Corps of Engineers' Expansible Body Program, AN/GPQ-T1 Air Force Trainer Radar and many other end item projects in the GCA category • also custom-engineered for the Matador Missile System communications shelters.

MODEL DH-73: 50,000 BTU/Hr. • for guided missile ground control equipment.

MODEL UH-73-2: 50,000 BTU/Hr. • used in U.S. Signal Corps AN/MSG-4.

MODEL UH-58-SC-1A: 60,000 BTU/Hr. • used in S-44, CPN/18A, MPS/7, M-109, etc.

MODEL UH-47-4S: 15,000 BTU/Hr. • for use in small and medium size shelters.

Engine heaters, instant lighting torches, refrigeration and air conditioning units are other Hunter products for military applications.

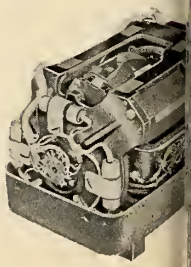
COVER: This large antenna is part of radar network on Army's missile tracking ship SS AMERICAN MARINER.

AND AWAY IT GOES!

125 MILES UP: A special ACR Electronics Corp. 16-millimeter camera snapped these sensational shots as the nose cone of a *Thor* separated over the Atlantic. Camera is of compact design capable of safeguarding film during impact with ocean. Pictures were taken through a quartz window of General Electric Co. recovery capsule located in the cone-shaped afterbody of the *Thor* nose cone. Capsule was ejected from nose cone shortly after it hit the water, 1400 miles from Cape Canaveral.

RUGGED



IN THE ROUGHEST, TOUGHEST RIDES, LEAR SERIES 1080 GYROS ASSURE CONTROL

Demanded by extreme vibration in missile environment: a small, rugged, reliable vertical gyro providing maximum performance. *Successfully engineered by Lear:* a compact two-degree-of-freedom vertical gyro with proven high quality at low cost.

SERIES 1080 GYROS WILL MEET YOUR APPLICATION REQUIREMENTS FOR DIRECTIONAL OR FREE GYROS AS WELL AS VERTICAL GYROS.

LEAR 1080 SERIES DISPLACEMENT GYRO

GRAND RAPIDS DIVISION

110 IONIA AVE., N.W., GRAND RAPIDS 2, MICHIGAN

The Remarkable City of Huntsville

One of these days the technicians of the Army Ballistic Missile Agency at Huntsville will bolt a circular cluster of H-1 Rocketdyne engines to a modified *Jupiter* test stand and push a button. The act will unleash some million and a half pounds of thrust and the most horrible roar that has ever been heard in Alabama.

ABMA announced this week that it had received the first of the new engines (see page 36) and that the entire system, named *Saturn*, would be flight tested in 1960. Work has already begun on modification of the test stand to accommodate this monster of the Space Age and now it is a matter of forging the eight engines together in the approved configuration. This work cannot be done, incidentally, in the ABMA "fab lab" where other missile construction goes on. The three-story high ceiling is too low to accommodate the cluster.

Huntsville, Alabama, is probably the only town in the country where such a test could be carried out with the consent and approval of its citizens. ABMA will simply inform Huntsville to hold its collective ears, say, between and 9 and 10 a.m., on the designated day and Huntsville will cheerfully, even enthusiastically, run whatever risk to its *tympanum* that may be involved. Anyone who has ever stood a quarter of a mile away during the testing of *one* 150,000-pound-thrust engine can imagine the noise a cluster of eight will make. Yet, Huntsville will probably be both hurt and incensed at any suggestion that the testing should be done elsewhere.

In many ways Huntsville is quite a remarkable place. Settled during the early days of America because a big gushing spring provided ample fresh water, it became important, particularly in Civil War days, because it was the junction of north-south, east-west rail lines. But it was never really anything more than a sleepy Southern village until the Army decided to get into the missile business and chose Huntsville and the Redstone Arsenal there for its operating site.

Huntsville then blossomed and boomed from 15,000 to its present hundred and some thousand, depending on how far into the environs you want to go. It has been a relatively orderly boom with roads, housing developments, schools and law and order keeping pace under a remarkably wise municipal government. (In schools, for instance, the rate of progression has been one classroom a day for the past several months.) A solid local newspaper has helped immeasurably, too.

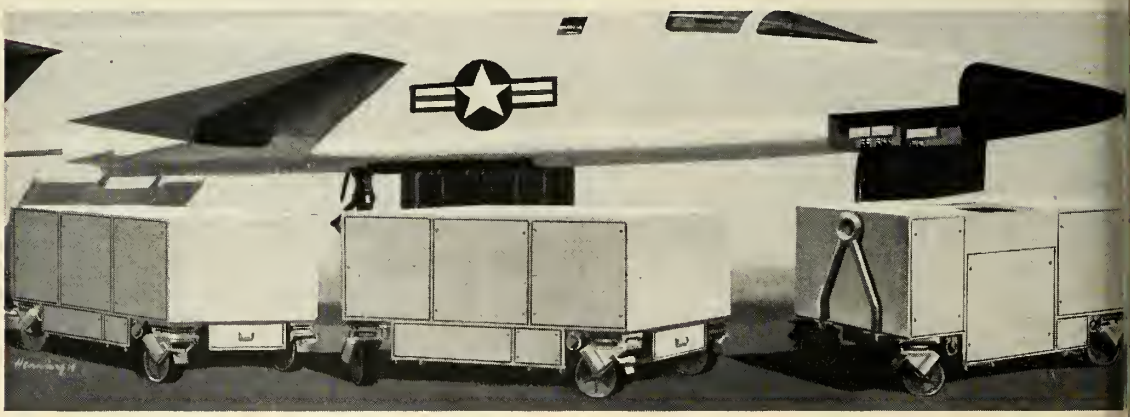
Chiefly, Huntsville cannot escape being notable for the enthusiasm it constantly displays for its missile and spacecraft building tenants. A new assignment for a new project in the cosmos brings cheers from the town—mayor, merchant and millworker. A cancellation, a setback or an adverse decision from the Pentagon brings corresponding gloom along Main Street. Roles and missions aren't involved. Huntsville is for the home team.

If this is a reflection of Huntsville's economic dependence on the Army's vast complex in the town's back (or front) yard, it is also a reflection of some highly-inspired labors in military-civilian relations with model results. Every military installation in the world could wish for such support.

A great deal of this amicable blending is, of course, traceable to the nature of the military establishment—the U.S. Army Ordnance Missile Command under the leadership of Maj. Gen. John B. Medaris. His organization at Huntsville is divided into two lesser commands—the Army Ballistic Missile Agency under Brig. Gen. John K. Barclay and the Army Rocket and Guided Missile Agency under Brig. Gen. John G. Shinkle. The redoubtable Wernher von Braun is, of course, director of development operations for the former, ABMA. Another occupant of the Huntsville complex, although a tenant, is the Ordnance Guided Missile School.

Obviously, the calibre of both military and civilians working in the three agencies must be and is a cut considerably above the norm in both education and intelligence. The Missile School, for instance, trains both Army and Air Force personnel in the operation of the *Jupiter*. It also trains NATO soldiers and airmen, both as individuals and in operational units, in the operation of Army missiles which have been or will be stationed overseas. (The curriculum is all set for the first Italian teams who will man the *Jupiter* IRBM stations in Italy.)

The 2000-person teaching and administration staff of the school, incidentally, averages (from secretary to commander) two years of college. Twelve months once passed without a court martial among the military personnel. The school introduced for the first time into military usage the TelePrompTer System of visual teaching and later added closed television circuits.



All in all, both Huntsville and the Army can be proud of military command and civilian population. Together they make a good team which, one of these days, will be holding its collective ears against the sound which will signal another step in man's adventuring in space.

Clarke Newlon

HOW TO FIND FAULT

...BEFORE COUNTDOWN

...BEFORE TAKEOFF

Just connect your weapon system, manned or unmanned, to one of Autonetics' two automatic checkout centrals: the GS-1A test console or the C6A BACE low-profile cart.

They render a GO or NO-GO verdict in *minutes* instead of hours. They do their critical job at least 100 times faster than a swarm of skilled technicians with meters and hand probes—and they do it with infinitely greater accuracy.

They meet the needs of the majority of modern weapon systems... accommodate adaptive equipment to test special electronic systems.

They're rugged: no relays, no tubes, fully transistorized. They're very simple to use: just show the operator which button to push. They're reliable: continuously take their own pulse.

Autonetics foresaw the day when the electronic systems inside a weapon would become as important as the frame that enclosed them... decided to automate the whole procedure. These automatic checkout controls—originally developed in cooperation with the Air Force and tested in the NAVAHO program—are now at work for both Air Force and Navy.

They're the heart of today's most *versatile* automatic checkout systems—only *practical* way to keep weapon system reliability at a ready-to-go pitch.

Automatic checkout centrals by Autonetics

IN THE PENTAGON

The death of Deputy Defense Secretary Donald A. Quarles can—and probably will—have far-reaching effects on the future of the Pentagon's widespread development set-up. Some of the effects of his death already showing up are . . .

In Dr. Herbert York's new Development & Engineering organization: The powerful centralized organization—a Quarles favorite—was just about to be given final approval by Defense Secretary Neil H. McElroy. Now a serious drive by the services and others is underway to lessen the power of York's office. But his chances of holding most of his own are considered good . . .

In top Pentagon development offices generally: The release of Quarles' strong hand is felt in many places. Once greatly-concentrated authority is flowing back into a more distributed pattern . . .

In Roy Johnson's ARPA: Many have thought that ARPA was headed for fairly rapid extinction. But now that McElroy has decided to stay on "indefinitely," it looks as if Johnson and ARPA will stay on "indefinitely," too.

• • •

The meaning: Control over development tightly held by Quarles could go to York . . . or partly to Johnson . . . or partly to the services. An inner struggle is on.

• • •

However, don't expect any drastic policy changes because of the appointment of Navy Secretary Thomas S. Gates as the new Deputy Defense Secretary. Like Quarles, Gates is known as an Administration man and will not try to alter the existing presidential party line.

• • •

A decision is expected very soon on selection of a prime contractor for *Dyna-Soar*, the boost-glide space missile launching platform. Competition is between Boeing and Martin. As M/R went to press the USAF Air Council had not received an evaluation report from Air Materiel Command but knew it was on the way.

• • •

Alterations on the *Redstones* which will be used to send the astronauts on their first trip into space will be made at Huntsville. The same capsule being developed by McDonnell for later use on the *Atlas* will be fitted to the early Army missile. First flight is expected before the end of 1959.

Watch for more big changes at Air Research and Development Command under new leadership of Lt. Gen. Bernard Schriever. Among those already announced: Maj. Gen. James Ferguson as ARDC vice commander, succeeding Maj. Gen. John Sessums who is expected to retire . . . Maj. Gen. William Canterbury as deputy commander for research, succeeding Maj. Gen. Leighton I. Davis.

ON CAPITOL HILL

One of the most significant moves by the 86th Congress is the attempt to tighten Congressional control over both missiles and space. Earlier this month the Senate Armed Services Committee called for requiring authorization of all missile programs as well as approval of appropriation requests. Now the House has called for authorization of all space programs for the next five years. All-out fights can be expected.

• • •

The Joint Congressional Atomic Research Subcommittee is preparing to crack down on the Administration over delays in development of the nuclear-powered plane—a proposed deliverer of the ALBM. The subcommittee understood a speed-up was planned. Then it was told that this was incorrect. If no speed-up is forthcoming, the subcommittee is all but certain to stage some of the hottest hearings of the year.

AT NASA

NASA is soon to announce the location of a site in North Dakota for one of four polar-orbit tracking and telemetry stations. Selection of the other three sites—in Alaska, Newfoundland, and Europe—is also supposed to be at hand.

• • •

NASA also is speeding up its search for an appropriate site for the proposed $5 million high-energy rocket development and test center. The center was cut from the NASA FY '60 budget by House members because NASA couldn't tell the Congressmen where the center would be located. Ideally, NASA would like to build it near the Lewis Propulsion Laboratories in Cleveland.

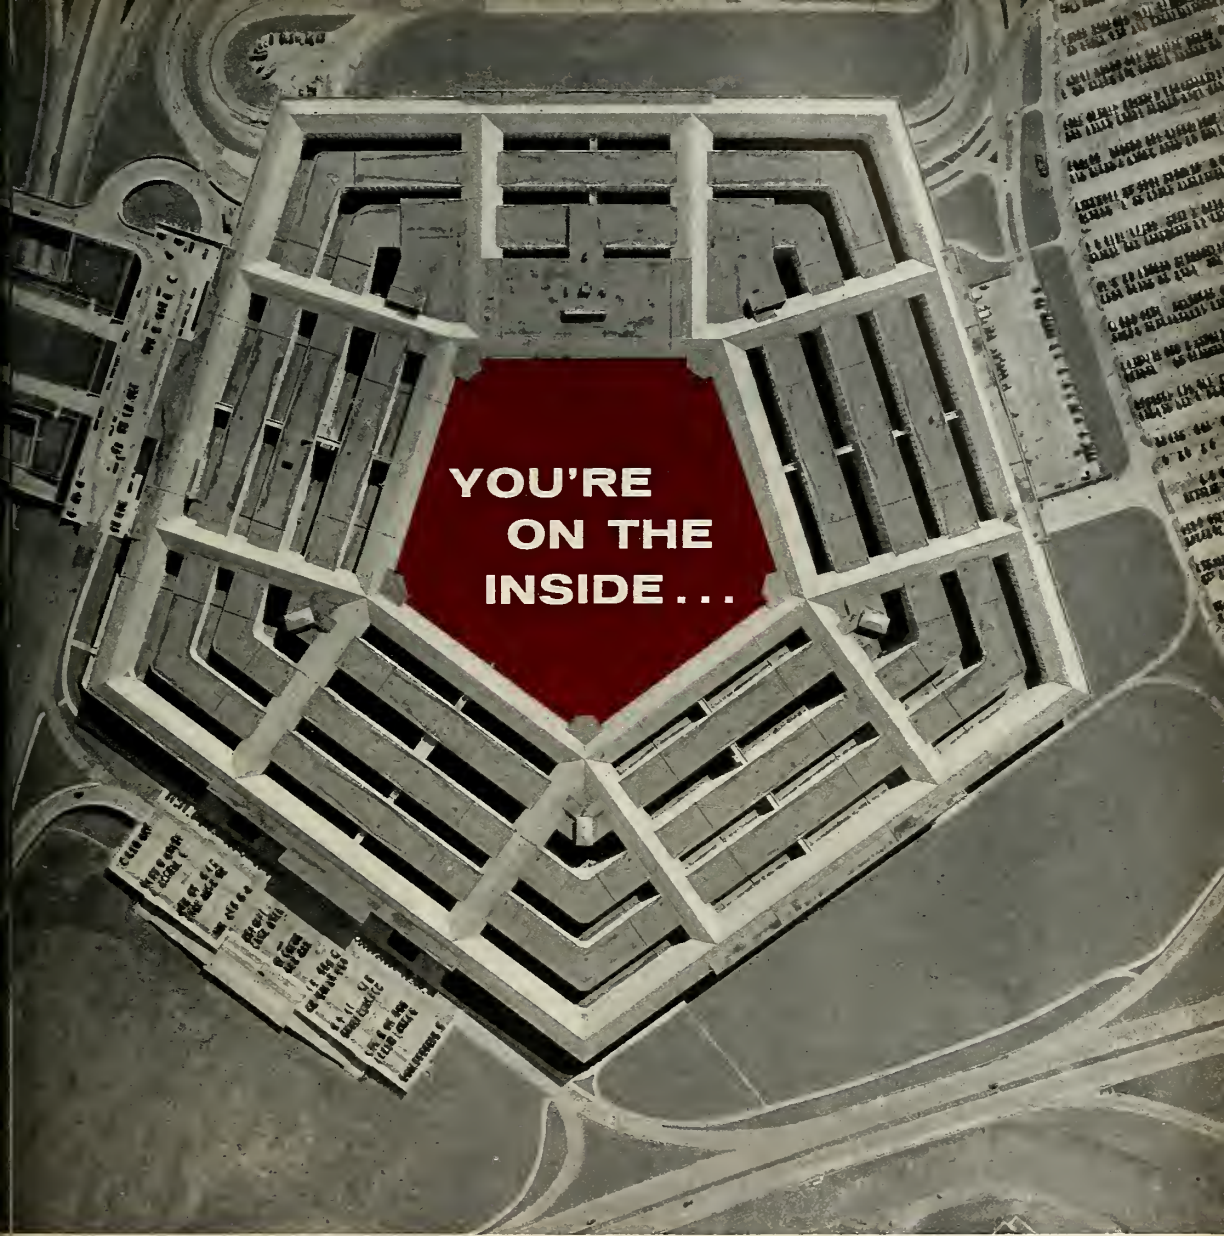
AROUND TOWN

The National Aviation Club is going to honor Dr. Theodore von Karman, one of the world's top scientists, as man of the month for May. Von Karman is chairman emeritus of the USAF Scientific Advisory Board.

8497-A

SPECIFICATION: AERONCA BRAZED HONEYCOMB STRUCTURES

DESTINATION: *MACH 3!*



To meet the critical demands of Mach 3 performance, new concepts in air vehicle structures have been evolved. Stainless steel honeycomb sandwiches, for example, are specified as major structural components in current weapons systems designed to operate in high mach environments.

Aeronca, a pioneer in the application of stainless honeycomb to air weapons, has developed advanced production methods and facilities under a proprietary research and development program. As a result, Aeronca is one of the few companies actually producing these high-temperature structures in quantity.

Aeronca is proud that its capabilities have been selected to support the North American B-70 and F-108 Weapons Systems.

BRAIN POWER

RAMJETS

THE PROBLEM. To realise for civil and military use the staggering potential of the ramjet engine—the jet engine with no moving parts that promises to prove the most efficient method of propulsion inside the earth's atmosphere.

THE ANSWER. Bristol teams designed and developed efficient ramjet engines. They flew many hundreds of supersonic test vehicles, since, of course, ramjets must be tested in the environment in which they are destined to operate.

This work culminated in the Bristol Siddeley Thor, the powerplant for the Bristol/Ferranti Bloodhound Guided Missile. But in producing Thor, Bristol built up Europe's most extensive experience of the ramjet and the most complete facilities for its further development.

And developed it will be. For today, the world's designers are beginning to see in ramjet engines the means of making *civil* supersonic travel a p economic reality.

How well has the brief been fulfilled? The Bloodhound can best answer for the milit plication.

Security forbids publication of the full fac this much can be said. The Bloodhound alre proaches full operational status with the RAF been ordered by Sweden. With the range an imparted by its Bristol Siddeley ramjets, the hound has greater effectiveness than any other to-air guided missile in the western world. An future defence needs dictate even higher speed longer ranges, even heavier armament, these ne be met without major alteration or redesign ramjet-powered missile and its system.

Ramjet power for manned aircraft is the nex

STRUCTURES

First nuclear-powered missile cruiser—Long Beach (to be commissioned in FY 1961)—will have two extremely high-speed fire control systems to launch the supersonic surface-to-air *Talos*. Mark XII magazine and mechanized loader being developed by General Electric under $8 million contract will weigh 350 tons—reportedly the largest single piece of ordnance ever ordered by the Navy. It is bigger than the fire control system for a battery of 16-inch guns. Two other nuclear cruisers also are programmed and will be similarly equipped for the Bendix-RCA *Talos*.

• • •

In the 1960 budget, the Navy discloses it is buying enough Raytheon *Sparrow III* air-to-air missiles to "provide slightly more than a month's combat usage." Amount for Martin air-to-surface *Bullpup* will last for "a little less than a month's combat."

• • •

Look for NASA to back off somewhat from its original decision to keep exclusive rights to inventions conceived under its contracts. Permanent regulations upcoming soon are expected to allow contractors to retain proprietary rights—but the final decision as to who gets the patent rights will come after the invention, and not before the contract is signed.

PROPULSION

North American engineers predict the missile-launching B-70 bomber may use 50 to 75 tons of steel products, mostly thin-gauge alloys and stainless sheets and honeycomb sandwiches. Plane will be built like a "flying fuel tank" with the basic load-carrying structure containing the fuel to eliminate internal tanks. Structure may be assembled by fusion welding to meet 400°F to 650°F temperature requirements.

ELECTRONICS

Competing for $12 million NASA contract to construct and manage *Mercury* range are: Thompson Ramo Wooldridge, Reeves Instrument, Aeronautics Systems, Cubic Corp., Austin Corp., IBM, Convair, Vitro Laboratories, Milgo Electronics, Temco Aircraft, Aircraft Armaments, Sylvania, J. G. White Engineering, Nat Harrison Associates, Chance Vought, Ralph M. Parsons Co., ITT Laboratories, Page Communications, Philco, RCA, Space Electronics, Collins Radio, Aerojet-General, Chrysler Corp., Westinghouse, Cook Electric, Western Electric, Brown & Root, Lockheed, Burroughs Corp. and Underwood Corp. Contract will be let July 1.

• • •

The Pentagon is earmarking $118.1 million in the 1960 budget for purchase of ECM (electronic countermeasures) equipment. ECM embraces both defensive countermeasures to help aircraft penetrate enemy defenses and electronic reconnaissance to obtain information on enemy missiles and other weapons.

• • •

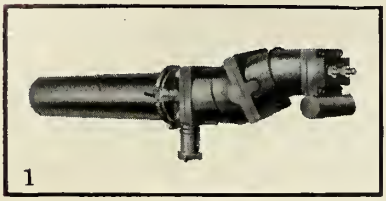
Best guess of the Air Force is that it will be sometime in 1963—four years from now—before SAGE (semiautomatic ground environment) combat command system is completely finished. It is now operational from Bangor, Me., to Washington, D.C.

ASTROPHYSICS

Russia is reported to be very actively researching the dynamics of outer space travel, which some day may be scheduled around solar storm activity. Avco's Dr. Arthur Kantrowitz is urging more U.S. research to open up this entirely new field of meteorology.

• • •

Soviet astronomer Nikolai Barabashov refutes the "green cheese" theory about the moon. He says the moon is not one color but many—brown, yellow, blue and red as well as green. Instead of being covered by cosmic dust or volcanic ash, as suggested by other observers, the Russian says the lunar surface is covered by a layer of rock grains.



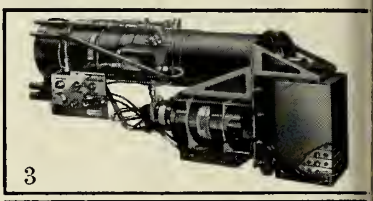
SPACE MEDICINE

Strictly paper combination of medical facilities at Brooks AFB and Lackland AFB in Texas and Gunter AFB, Ala., will be made soon to form the AF Aerospace Medical Center. All facilities will remain at their present locations.

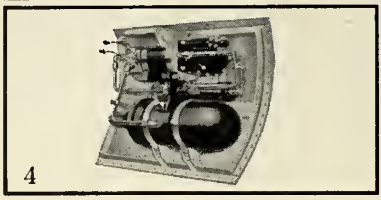
More about the Missile Week on page 46.

EFFICIENT, COMPATIBLE AUXILIARY POWER SYSTEMS...

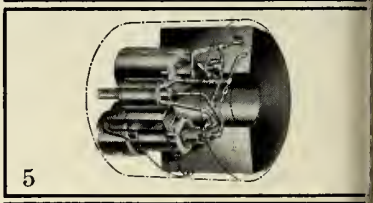
designed and built by VICKERS



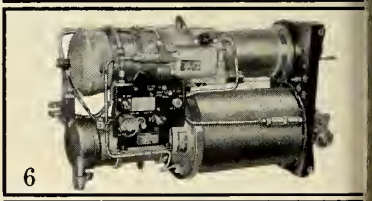
1



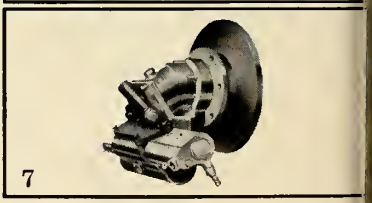
Missile progress demands unquestionable reliability, maximum efficiency and compatibility of the system with the overa vehicle. These rigid standards are being met by Vickers wit *missile industry-tailored* R & D, engineering, production an service capabilities blended with extensive experience gaine from a large number of successful accessory applications o a majority of the current production missiles.



Typical Vickers designed APS's include:



1. Hot Gas Systems
2. Close Frequency Systems
3. Battery Powered Systems
4. Door Mounted Systems
5. Blast Tube Configurations
6. Turbine Powered Systems
7. Flywheel Systems



2

3

4

5

6

7

Using proven components as building blocks, Vickers can shorten APS development time and speed delivery . . . all with the assurance of dependability. These advantages are passed on to you whether your specifications call for one or any combination of the following:

- TEMPERATURE TOLERANT SYSTEMS
- MAXIMUM EFFICIENCY
- CLOSE FREQUENCY CONTROL
- HIGH SPECIFIC POWER
- HIGH OR LOW DRIVE SPEEDS
- ACCURATE VOLTAGE REGULATION

Pitfalls of Missile Business Financing

Growth can be deadly. But here's where to get capital —while you still can!

An M/R Staff Report

WASHINGTON—Need money? Final- get that first really big contract only find you can't finance it? Short of ital for expansion, market develop- nt, new business, in-house R&D, ? Got backlogitis (symptom: ched bank account)?

In a word, are you suffering the ncial growing pains of a growth npany in a growth industry? If so, a money doctor—right away. nerwise, lacking time to effect a e, you may end up being embalmed ler the terms of the Federal Bank- tcy Act—for without a diet of bal- ed management and proper finan- nourishment, growth can kill.

More and more companies in the siness are beginning to realize that hnological posers aren't the only idaches plaguing missilery. There are ney problems, too, that can be every as tough as developing a leak-tight prine joint, a 283,000-psi solid rocket tor case, or a continuous space wer source rated at one kilowatt per ice of weight. What many compa- s don't know is that there is a good ker's dozen or more of ways to ward these money troubles.

In 1950 the missile market came to mere $500 million. Today, if you lude missile, space and related sup- rt procurement, it's nudging $9 bil- n. For 1965, half a decade hence, n conservative estimates peg the al at $30 billion a year. It's one of most rapid growth patterns in peace- e history.

And with the growth of the indus- many companies are growing too— ne at a more rapid rate than they afford. Too many—particularly all businesses plunging headlong into business—find this out too late. en they lose an important contract, cause they can't finance it, and thus mage their reputation; are forced to rge with a larger, moneyed com- ny, with loss of identity and too en loss of the creative secret of their success; or, worst of all, are driven into bankruptcy.

The basic financial hazards of growth all add up to too little money to finance: expansion, current business (cost of materials and labor in servicing too big a backlog can be, and often has been fatal), new business, contract termination (other bad times), modernization, research and development, etc. And to these general hazards of growth must be added the numerous specific handicaps of current defense business policies. Here are just a few of these:

• **Tight competition** (sometimes from companies *buying* their way into the missile market) for advertised bid contracts, with resultant skinnier profit margins.

MANAGEMENT TRAPS

A. Poor Financial Planning
1. Inadequate Records
2. Cumulative Losses
3. Neglected Tax Payments
4. Expansion Beyond Resources
5. Excessive Fixed Costs

B. Poor Coordination Between Manufacturing and Selling
6. Lack of Product Development
7. Lack of Diversification
8. Lack of Data on Own Customers
9. Contracted Entire Output to Single Buyer
10. Lack of Market Research
11. Continued Policies of Bankrupt Predecessor
12. Legal Problems

C. Poor Other General Administration
13. Family Factors
14. Lack of Administrative Coordination
15. One-Man Management
16. Lack of Technical Knowledge
17. Absentee Management
18. Internal Conflict

• **Nature of CPFF contracts,** particularly in missilery, where often as not changes in requirements and technological modifications force the cost way, way up with no commensurate increase in the fee which, as the term says, is cost-plus-FIXED-fee. This reduces earning power of both working capital and equity investment.

• **Need to finance 20% of inventory** of certain cost-type contracts. This gets particularly worrisome during the shift from development to production phase when, again, change orders may pile up that inventory perilously high.

• **Contract termination,** sometimes with cancellation coming with the quick brutality of a telegram. This not only means loss of business, but you will have to finance termination costs until the red tape permits final payment.

• **High cost of much missile R & D,** where you may have the best technical qualifications in the world but, lacking evidence of financial ability, you lose the business.

• **Chances of losing the production contract** to someone else, after you made a profitless low bid on the R&D phase just to get into the program—figuring to make your money on the production run.

• **Obsolescence of a technology** in which you were leader, because of development of a newer, better method. Unless you've got the capital as well as the know-how to diversify or improve your own techniques, you're in trouble.

• **High materials costs** relative to processing costs, which could force you to give up a particularly lucrative piece of business. A recent example was a monstrously big, devilishly complex nozzle for a development rocket motor. Use of a so-called "exotic" metal pushed materials cost to over $400,000, compared to only $80,000 in processing costs—just for one nozzle. Business like this takes some heavy financing.

This usually happens because Washington doesn't want to upset its cash expenditure budget system—or, maybe, because (if you're a subcontractor) one of your best customers may be maneuvering for a merger and wanting to make his cash position look as good as possible.

• **Performance bond requirements** on some especially large contracts, such as engineering, manufacture and assembly of, say, a hypersonic wind tunnel—where the bond may run $500,000 or more.

• **Need to finance in-house R&D** if you're going to have any kind of favorable patent position. If developed under contract, patent rights usually belong to the government.

All these add up to increase the dangers of doing business in the missile market, and tend to make financial collapse, when and if it comes, all the more sudden. They also make it pretty obvious that defense business, in itself, does not always provide an easy route to expansion.

But for the company that looks to its financial future in time, there are many roads to relief. This is particularly true of smaller companies, due to Federal small business legislation. They range from going to the public with a stock issue, to a 100% government loan from the Small Business Administration.

Large companies face virtually the same financial problems as small companies—government limitations on earnings from defense business, renegotiation, taxes, hazards of CPFF contracts, etc., versus continuing and expanding needs for both equity and working capital.

Big company management, however, is usually well enough balanced between technological, administrative and financial know-how that it becomes aware of financial troubles at their onset. And, knowing of the impending danger, it is also aware of the various alternative solutions.

Small companies, however, are often built on the technological and/or sales abilities of one or two men who frequently don't recognize the impending danger until it's too late or, if they do, may be aware neither of the various solutions available to them nor of how to go about taking advantage of them.

• **Many sources**—There are many sources of money, both direct and indirect. Direct sources of capital break down between investment and borrowings. Indirect sources evolve from competent corporate management. Here are some of the direct sources open to both big and small companies:

• **Public stock issue**—Even if profit and loss and balance sheets seem to leave something to be desired, so long as you're in the missile business and not obviously bankrupt, your stock should be in good demand.

Look at the prices some missile stocks are bringing, and it's obvious that more often than not the public is buying on romance, rather than statistics. And the newer the "find," such as a missile stock on the market for the first time, the hotter the demand. By "missile company," we mean any company demonstrably connected with the business—not necessarily one of the big prime contractors. Some recent new issues have been over-subscribed tenfold or better.

Going to the public for money doesn't mean you have to give up control. You can usually keep control—and it doesn't require a majority interest. And of course there are many different kinds of stock—preferred without voting rights; common stocks that have a first call on dividends up to a certain point, with limited voting rights and which may be convertible to full voting shares; and many more. One currently successful money-raising technique is the issuing of subordinate debentures with stock warrants enabling holders to buy common stock at a favorable price. If you're interested in these possibilities, consult a recognized expert in the field.

• **Private investment**—This can be done by one of the big financial houses or an individual. Examples of the former are the Lehman Bros.-General Dynamics relationship, which has been very profitable for both, or the Johnston-Lemon-Atlantic Research relationship. This approach usually means participation in the management of your company by the investment house, but at least you'll get top financial advice—which may be just what the doctor ordered.

One problem missile companies may run into in going to, say, a Wall Street financial house, is that people there may not have a ready technical appreciation of just what it is your company is so good at. One financial consultant puts it this way: "You're trying to raise money for a bizarre and unestablished product on a whimsical money market." However, this problem is rapidly disappearing with the mounting business acceptability of missilery and space flight.

Two notable individuals in the business of picking up and backing "golden opportunities" are How Hughes and Laurance Rockefel What kind of deal you can make such an arrangement depends on individual, and individuals vary grea But odds are that one thing they have in common is a desire to fol their money with their control.

• **Long-term borrowings**—This can be from an insurance comp or, again, an individual. Banks are help, since long-term business lo aren't bankable. Long-term lo usually mean issuing first mortg bonds, general mortgage bonds (b of which must be more or less secu or debentures, which are little m than interest-bearing promises to p Usually it's tough for a small c pany to raise capital this way, un it can present a really convincing ture of good management and g prospects.

In any case, make certain you d borrow so much at such an inte rate (on bonds now running ab 5%) that you eat up the meager pr allowance (7-14%) permitted on g ernment business.

• **"V" loans**—These are prima working capital loans whereby the n tary services (and certain other g ernment agencies) with ultimate sponsibility for your defense contr will guarantee up to 90% (excepti up to 100%) of a bank loan amounts limited by an "asset formu but not to exceed 90% of the "t rower's investment in defense prod tion operations."

Maturity dates are set to "confo reasonably to the borrower's financ requirements for defense product contracts on hand at the time of guarantee."

These are available to both la and small business and to both pri and subcontractors. What you're do must be essential to the national fense. The responsible military serv the local Federal Reserve Bank and bank that's going to actually loan the money all participate in appro first, of a certificate of eligibility, a second, of the actual guarantee.

One real advantage of this syst is that it can be arranged as a volving account—moving up or do with your volume of defense busin

• **State and local developmen** These are privately-owned corpor entities set up in states and local c munities for the double purpose bringing new business to the area fostering the growth of companies ready there.

These are eligible for long-te loans from SBA up to the amount their borrowings from other sour This money they can use, in turn, provide equity capital and long-te

is to small business. However, un- their charters they can also help business in other ways—provision low-rent plant space, for example. re are over 2000 such development panies in the U.S.

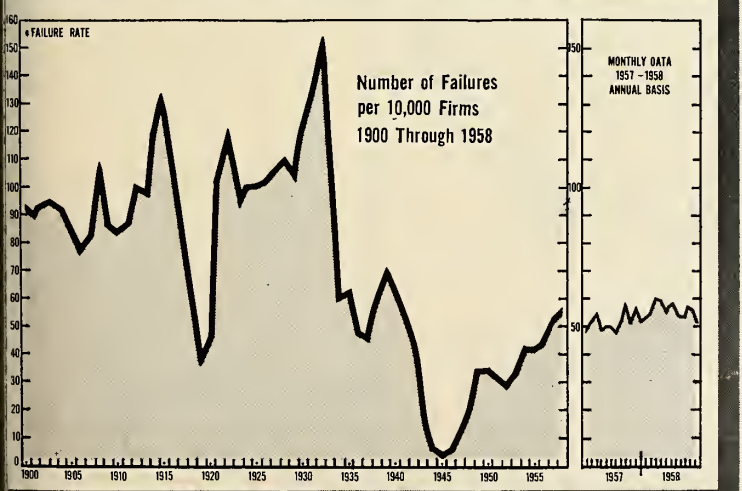
• **Agreements with larger firms**—e the larger company supplies both king capital and back-up produc- capacity. You may ask: But why uld a big company make such an ement? Why don't they go out and the business themselves?

The answer will usually be: Be- se they can't. They don't know their around the missile business yet don't have a technical familiarity its problems and requirements. ur company, on the other hand, may e an intimate knowledge of all these gs. If so, you probably pass up e sales opportunities than you go r—because you haven't the physical t and cold cash. So, you trade iness and know-how for cash and acity.

It's a good deal—if it works. But will work out over a profitable pe- of time only if there's a rare meet- of minds and temperaments. Real- also that the larger company may k with you only long enough to the necessary know-how and then ll of a sudden he's no longer bene- or, but competitor.

Nevertheless, it may give you the athing spell you need. Should you er into such an arrangement, be pared to demonstrate both joint individual responsibility to your tomers.

• **Special financial aids**—The gov- ment usually defines a small manu- uring business as a company with 250 employes or less, but with numer- ous exceptions up to 1000. Small serv- ices companies are those that gross $5 million or less—again with some ex- ceptions. As a result of various acts of Congress there are now a number of special financial aids to small busi- ness—nearly all administered directly or indirectly through the Small Busi- ness Administration. Here are some of the aids it offers:



• **Participating loans**—In this case SBA goes in with a bank in loaning you long-term money (up to 10 years at 5½% interest) for working capi- tal, expansion, research and develop- ment, modernization, consolidation of accounts payable, etc. In these SBA will supply up to 90% of the joint loan, up to $350,000 as its share.

• **Direct loans**—In this case, SBA supplies all the money. Maximum ma- turity is still 10 years; interest, 5½%. The top limit of an SBA direct loan is also $350,000. Actually just over three- quarters of the loan applications com- ing into SBA are for amounts under $50,000. During the July-December, 1958, period, 262 loans over $100,000 were approved, including 21 over $250,000.

However, few were missile com- panies. In March, of over 1000 loan applications coming into SBA, fewer than 10 could even be remotely con- nected with the missiles and space flight effort. Of this situation, SBA says:

"With exceptions, it is the opinion of the study team that the prime con- tractors were not familiar with SBA nor have they sought the assistance of SBA."

RATES OF BUSINESS FAILURES

1958, there were 56 failures per 10,000 firms compared with 52 in 1957, but the of failures was 55 in the second half compared to 57 in the first half of 1958.

For an idea of how small business in general avails itself of SBA's loans, in the last six months of calendar 1958, 34.2% of the approved business loans were for working capital; 19.2% for facilities; 36.7% for consolidating ob- ligations, and 9.9% for equipment.

Kinds of companies to whom loans go include: chemicals and allied pro- ducts, fabricated metal products, ma- chinery, electrical machinery, etc., as well as a wide variety of wholesaling, retailing and servicing companies.

• **Equity capital investment**—This is possible by one of the new Small Business Investment Corporations auth- orized last year by Congress and just now being set up. Seven have been established. Sixty applications are pend- ing, of which 30 have tentative ap- proval. Albeit indirectly, this puts gov- ernment into equity financing for the first time.

SBIC's are authorized to supply equity capital in return for common stock not exceeding 20% of the SBIC's own capitalization, or to make loans in return for debentures that may be later convertible into common stock at the sound book value as of the day of the loan. SIBC's also make long-term loans secured against assets. On some of the money it lends, an SBIC may get between 8 and 12% interest— which may or may not be any bargain, depending on your need.

To be eligible for help from an SBIC, a company must be privately owned; not dominant in its field; not have over $5 million total assets; and must not have had annual earnings after taxes in the past three years in ex- cess of $150,000. If its stock is traded or it has had a public stock issue of $50,000 or more, the company is not eligible.

Exceptions to all these regulations are possible through application to SBA, which has close control over the SBIC's due to the fact that (a) it licenses them, and (b), it puts up part of their capital.

To get this kind of aid, no change in Securities & Exchange Commission registration is needed, and you must buy stock in the SIBC up to 2% of the loan or $50,000, whichever is less. The investment company will not ac- quire control of your company unless your management turns out to be in- adequate or its investment is jeopard- ized.

• **Dollars not answer**—For all these many ways to raise money, dollars alone won't assure a healthy maturity for the growth company. If its man- agement isn't good, more money only means a more expensive funeral—if not today, then tomorrow.

Up to a point, sound management

(Continued on page 47)

Solid Rockets in Space: Where Do We Go?

Bright future seen for deep space probes where more than a simple ballistic trajectory is needed for exact astronavigation

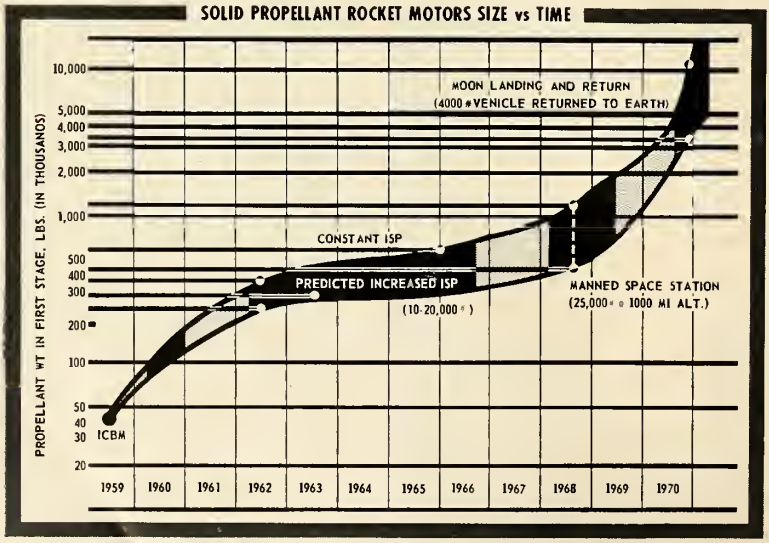
by Paul Means

WASHINGTON—A strong argument for the suitability of solid rockets for space missions—even with the advent of some of the more exotic propulsion systems—has been made by Ben F. Wilkes, an applications engineer with Astrodyne. Speaking before the national aeronautical meeting of the Society of Automotive Engineers in New York, Wilkes said the basic advantage of solids in space work is their reliability, and the fact that solid propellants and motors can be designed to handle specific jobs during the various phases of a space vehicle's flight.

Whether solids will be used as a primary propulsion system in space vehicles 10 years hence depends on many undeterminable factors, principally on the relative progress made by other types of rocket motors. If ion, fusion, plasma, or nuclear rockets approach operational status within this period, they could be used for the upper stages, and conceivably for the boosters. Without them, rocket makers will have to rely on the more advanced liquid and solid chemical rockets.

Along with development of other propulsion systems, Wilkes believes following factors will help decide fate of solids as a prime propellant space vehicles:

• The upsetting of the space roc development timetable due to spe problems not now known—such as unexpected radiation levels encoun ed by the *Explorer* satellites.



• Changes in national and in national politics (and space resea budgets) which could accelerate slow down developments.

• Changes in military objectives plans versus, or in conjunction w commercial uses which could a types of propulsion systems to be u as well as time scales.

• **Upping energy**—As a space hicle launcher, solid propellants h the disadvantage of being at the end of the energy spectrum of prim energy sources (see table). Some provement can be expected. Wilkes lieves, in the ability to convert a sol reaction energy to kinetic energy

He is supported in this conclus by H. W. Ritchey, vice president the Thiokol Chemical Corp. In article in the House Astronautics Space Committee's staff report on *Next Ten Years in Space,* Ritc stated: "Although a 1 million-pou thrust liquid combuster may be fe ble, solid engines developing thr 10 to 100 times this figure present straightforward engineering proble

• **Strong points**—Solids also n be considered as space vehicle laun ers, Wilkes feels, because of their liability, simplicity, quick response start, and the ease with which they be staged. Using five or six solid st

VERSATILE SOLIDS for space vehicles can grow in the next decade. Top curve assumes no change in available energy; bottom assumes increase.

a space vehicle launcher, he re-
ds, allows increases in the payload
h less going to gross load.

The other advantage in using a
lti-stage solid space vehicle launch-
according to Wilkes, is that "if the
rational and environmental require-
nts for these motors are carefully
sidered beforehand and one motor
ot expected to be everything, then
pellants and motors will be found
handle specific jobs. For example,
notor that is to operate in space
uld not be required to meet the
le handling and storage require-
nts that an everyday rocket motor
artillery use must meet."

The various stages, Wilkes believes,
ld be designed to optimize perform-
e, i.e., "propellants with different
and burning characteristics, propel-
weight ratios, nozzle designs,
mber pressures, throat area ratios,
t"

Low motor weights could be util-
in the final launching stages, after
rocket has reached an altitude
re there are near-zero drag losses,
ause the vehicle at that point could
accelerated to theoretical maximum
city independent of thrust.

Problems yet to be solved before
ds become effective space vehicle
chers, Wilkes believes, are those of
ieving close dimensional and weight
rances of hardware and propellant
rge, and possible close tolerances
ballistic parameters and thrust ter-
nation.

• **For moon trips**—An area in
ch solids have an advantage over
greater-specific-impulse liquid pro-
ants is in proposed manned, unpow-
d, round trips to the moon. High
jection velocity, Wilkes points out,
uld not allow the space vehicle to
the moon's field as a source of sub-
tial trajectory shaping. The idea is
keep initial velocity low so that the
owered vehicle will travel behind
moon and then be deflected around
its return trip to earth.

Low projection velocity, and its
lting increase in payload, would
be advantageous for missions need-
great increases in payload weight,
h as missions requiring the expendi-
e of large amounts of electrical
rgy in flight, or manned flights
re the demands of nutrition and a
ble environment increase with flight
ation.

Low projection velocity solid rock-
t would also give the "marked sensi-
tivity of flight duration to small errors in this velocity," Wilkes asserts. The close scheduling needed for an unpowered flight into deep space and return to earth would "require very close control of projection velocity simply to prevent variation in flight time," and solid motors could be used "to give the minute corrections."

One area in which solids may have a promising future, according to Wilkes, is in deep space probes to planets or space stations where more than a simple ballistic trajectory is needed to allow the space vehicle to arrive at the exact point in space at the exact point in time.

• **Disturbing forces**—Besides the minute exactness of burnout velocity and position necessary for a space vehicle to start on its way into space, Wilkes lists 16 forces at work in the universe for which the rocket will need counteraction or thrust correction.

These are:

(a) The last-minute aerodynamic forces escaping from any atmosphere;

(b) Errors in burnout velocity and position of the vehicle—any residual propellant or unnecessary weight could affect the whole trajectory;

(c) The geomagnetic field of the earth, sun, planets, asteroids, etc.;

(d) Electrical forces, both known and unknown, and even the magnetic fields generated by induced currents in conducting parts of the vehicle itself;

(e) Radiation forces from the sun;

(f) Cosmic rays;

(g) Radio noise from the sun and other space objects;

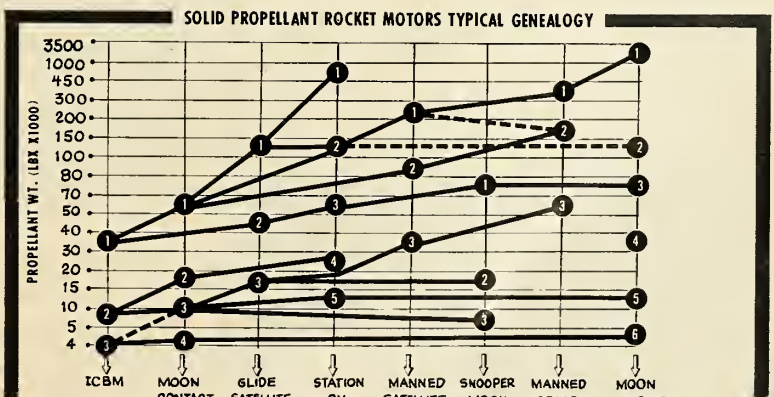
(h) Temperature changes;

(i) Meteor impacts;

(j & k) Einstein Mechanics and Newton's Laws—will they hold true in space?

(l & m) Navigating in space, and the refraction and abberation of the instruments used for navigation;

(n) Bulge perturbations in the gravitational forces in the planets, sun, etc., and their effects on the space vehicle;



(o) Errors in earthly calculations and observations of mass and gravity of space vehicles;

(p) And the motions of the internal masses of the space vehicle.

Thrust correction and counteractions by solid-propellant rockets, Wilkes believes, could compensate for, and even eliminate, the effect of some of the forces. Others, he believes, could even be used to stabilize and orient the vehicle. Other forces, such as the effect of radio noises on guidance control from earth, would need man in the vehicle itself to correct.

• **Mars and back**—Wilkes describes how simple, reliable, solid-propellant rocket motors could provide the necessary guidance control for a space vehicle travelling from earth to Mars and back:

After arriving at an earth satellite space station, the vehicle would then make 377 revolutions about the earth until it arrived at the point where its

HERE'S HOW solids will grow in size and number of stages during the next 10 years of rocketry advancement in space exploration.

total energy would be equal to that of a body falling to infinity from that point.

Shortly after this point is reached, after 108 days of flight, the trajectory would start its hyperbolic path as the vehicle accelerated.

The problem now is to put the vehicle into a trajectory which will allow it to arrive at Mars. If thrust is shut off before reaching the escape point from the earth's pull, the rocket would continue its eliptical orbit around the earth. If thrust is shut off after the escape point is reached, the rocket would go into orbit around the sun.

But by cutting off thrust slowly, the rocket's trajectory can be changed from a spiral to a circular one. As soon as the correct position is reached, thrust is switched on and the vehicle continues on a spiral path about the sun towards Mars.

The advantage of using solid rockets for thrust corrections during heliocentric departure, according to Wilkes, is to counteract the possible errors due to (1) technical cutoff errors in the escape hyperbola; (2) uncertainty in knowledge of the combined mass of Earth-Moon-Sun System; and (3) the uncertainty with which the mean Sun-Earth distance is known, which is detrimental to the accuracy of the transfer orbit because of its sensitivity to inaccuracies in tangential velocity.

• **Bending trajectory**—Guidance, which could be provided by small solid rockets motors, is needed during midcourse, and at the end of 194 days of flight, when thrust direction is reversed 180 degrees and the rocket decelerates.

Solid-Propellant Rocket Motors
Typical Advanced Propulsion Sys. Family

FIVE DIFFERENT families of solids could handle most of a space vehicle's propulsion needs. Ultimately envisioned is 4.5 million pounds of thrust.

After 275 days, thrust is again reversed and the ensuing acceleration bends the trajectory toward the Martian ellipse. Wilkes estimates that correction impulses of only 200 to 400 fps will be sufficient to generate encounter distances of about 10,000 nautical miles.

Correction thrust is used again if the vehicle heads for the Martian ellipse too early or too late. If too early, according to Wilkes, it directs thrust first rearward then slowly toward the sun to compensate for the sun's attractive force. If it arrives too late, it reverses this process.

Solid rockets could also be used on the final approach, when the rocket needs some thrust to force it closer to Mars, and some side thrust to create a spiral so that it will not fall straig into Mars. The solids also would ideal as the retros and/or verni which decelerate the rocket into circular orbit around Mars.

An analysis of this projected t to Mars, according to Wilkes, "ad up to the need for guidance contr Simple, reliable, solid-propellant roc motors used all along the way w make sure the desired terminal or is reached . . ."

• **Solid versatility**—Wilkes adm that liquid propellants probably will ways be ahead of solids in the ava able propellant energy or specific i pulse, and that for this reason liqu will probably be the primary prop lant used for a large space vehi booster's first stage. But because their instant readiness and reliabili he thinks that solids will be used m and more for the rest of the stag And their great advantage is that t can be used in all areas of space flig

The accompanying tables indic how solid rocket motors will grow d ing the next decade to propel some the space vehicles now in the pl ning stage. Still to be overcome large solid rocket engine design are problems of making the propellant tain its shape and reliability throu out burning.

Wilkes forsees solid rocket mot developed up to a scale where t would be 200,000 lbs. in weight, 500,000 lbs. in thrust, 60 ft. in leng 96 inches in diameter, 90 seconds duration, and a .90 propellant (to t weight) fraction.

Clustering rockets of this size, smaller ones, according to Wilkes, go on ad infinitum, until structu material can't withstand the strain

INDICATION OF low energy of solids compared to other primary energy sources. However, this can be overcome by staging and clustering.

Space Technology Laboratories is responsible for the over-all systems engineering, technical direction and related research for the Air Force Intercontinental and Intermediate Range Ballistic Missile Programs and for the highly successful Thor-Able series of ICBM range re-entry launches. ■ In addition, STL carries out special experimental projects for such agencies as the National Aeronautics and Space Administration and the Advanced Research Projects Agency. On behalf of these agencies and in conjunction with the Air Force Ballistic Missile Division, STL designed and produced the Pioneer I payload, one of the most sophisticated fact-finding devices ever launched into space. In addition, STL provided systems engineering and technical direction for the Air Force satellite, the Atlas SCORE. ■ In support of these and future requirements, STL's activities provide a medium through which scientists and engineers are able to direct their interests and abilities towards the solution of complex space age problems. STL invites inquiries regarding staff openings in any of the five major areas of the company's activities.

Electronics Laboratory
...provides technical direction for, and conducts studies leading to, design and specifications of advanced guidance, control, and communication systems; also packaging, environmental testing and over-all checkout.

Physical Research Laboratory
...conducts basic research including analytical and experimental investigations in magnetohydrodynamics, thermonuclear power, plasma physics, and low temperature solid state physics.

Astrovehicles Laboratory
...conceives, evaluates, designs, develops, and tests space vehicle systems; provides technical direction of propulsion, nose cone, and airframe subsystems; explores new propulsion, airframe, re-entry, and ground handling techniques.

Computation & Data Reduction Center
...provides a centralized mathematical and computing facility and engages in advanced research in data systems, information theory, computation systems and automatic programming, systems and hardware simulation, and applied mathematics.

Systems Engineering Division
...has the over-all responsibility for the system integration of the Atlas, Titan, Thor, and Minuteman weapons systems, in addition to responsibility for technical direction of the airframe, sub-system, assembly and test, and ground support activities; evaluates proposed future weapons and space systems.

...NEWS IS HAPPENING AT NORTHROP

Now being produced and delivered to the U.S. Army Signal Corps, the Radioplane SD-1 gives greater battlefield surveillance flexibility to combat units than ever before. (This photo of terrain was actually taken from an SD-1 at 1,000 feet.)

RADIOPLANE PRODUCES FIRST COMBAT-READY SURVEILLANCE DRONE

Meeting tough Army Signal Corps requirements and being produced in operational quantities, the SD-1 is proved and ready to fly unmanned photo reconnaissance missions for tactical troops.

Highly mobile, the camera-carrying SD-1 may be zero-length launched in rough terrain from a camouflaged position. It is flown by remote control over enemy installations on surveillance missions without risking a pilot's life or man-carrying aircraft. Within minutes after the SD-1 returns from its mission, photographs are delivered to the requesting unit.

Other specialized sensory equipment may be carried by the SD-1 depending on particular mission requirements.

This Army-Radioplane achievement exemplifies Radioplane teamwork with all of the U.S. Armed Forces. Radioplane provides a complete drone family spanning medium speeds through supersonic performances.

What's the future for electronics in GSE?

Electronic Output to Double by 1965

by William E. Howard

WASHINGTON—Plotted on a graph, fortunes of the Nation's electronic ustry resemble the upward arc of ICBM's trajectory. For the next ade the outlook is for the industry keep on expanding at an even dizzier e.

Propelling the industry on its head- g flight are demands to produce re and more complex missile systems d in with a growing and extremely ricate "decision-making" alarm net- rk to give the U.S. a capability for tant response to Soviet attack.

And as missiles become operational, industry is being pressed to manu- cture in greater and greater quanti- s the equipment to back them up on ground. Seventy-five percent of *an's* guidance and control system is the ground; *Minuteman's* is ex- cted to be in a 90-10 ratio.

Taking a looking into the future s week, Electronic Industries Asso- tion President David R. Hull told R that the Nation's electronic out- t must double by 1965. This will an at least 50% increase in existing nt capacity, he said.

He sees the government spending total of $30 billion on missiles be- en now and 1965—with more than lf that amount going into missile ctronics.

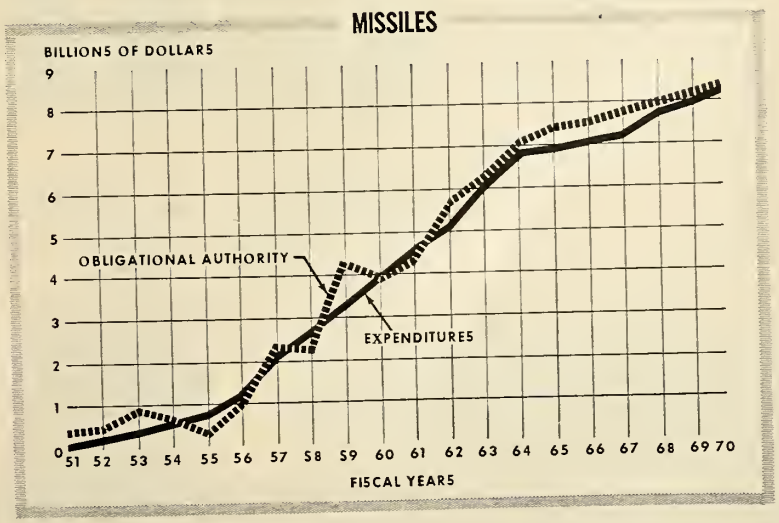
The EIA estimates for the elec- nic share of the missile budget for 1960 fiscal year is $2 billion. This more than half of the $3.922 billion al EIA expects the armed forces spend on missiles.

For the period through 1970, the ociation says "a total of over $100 lion" will be available for electronics enditures from this source alone. y the end of the period," it adds, 0-25% of the defense dollar will be marked for electronics."

• **Space funding**—General increases procurement by the government for ctronic equipment, for commercial ation and space activities are also ected to boost the industry's output. A believes ARPA's appropriations will fall off from $455 million in 1959 to about $170 million in 1964. But, says the association:

"NASA will probably finish fiscal 1959 with authorizations of about half a billion dollars, and will triple this by 1964. By 1970 space programs are expected to be operating at a level over $3 billion.

"FAA (Federal Aviation Agency) is expected to nearly double its 1959 fund level, reaching $1.2 billion by 1964. Increasing air activity will maintain this trend. By 1970 authorizations may exceed $2 billion."



EIA experts are inclined to discount suggestions that the defense budget will be enlarged abruptly by Congress short of an emergency. The current defense budget of close to $41 billion, they point out, along with the non-defense budget of about $36 billion is already pushing Federal credits to the limit.

Accordingly, these experts believe actual defense spending will rise slowly over the next 10 years—in step with the gross national product—to a top of about $57 billion.

• **Ready to grow**—Individual electronic companies, Hull says, already are planning ways of coping with the expected expansion. He said a number have considerable reserve facilities and the government has some backup plants.

Third of a series on Missile Support

THE GRAND CENTRAL REPORT

Tennessee Gas Transmission Company and Food Machinery and Chemical Corporation, the parent companies of Grand Central Rocket, have extensive investments in the energy field. In addition to their interest in Grand Central, TGT is in the oil, gas, and petrochemical fields, while FMC has three other divisions in dimazine, peroxygen chemical and boron propellants as well as other fuel and related products.

It is the long-range plan of both parent companies to build a strong position in the energy field. Grand Central Rocket Co., as a developer and producer of solid propellants and solid rocket motors, is a vital part of this plan.

It is our goal to make Grand Central Rocket, under new and aggressive management and with the addition of major facilities, one of the strongest and most capable solid propellant rocket organizations in the country.

J. J. King

Most firms presently are operatin one shift and a step-up to two and thr shifts a day alone might boost outp by over 100%. However, Hull sa training personnel looms as a maj problem and it has been industry experience that second and third shi operations are not as effective produ tionwise as the primary day shift.

To finance required additional f cilities, Hull said the industry woul be able to lay out the capital for bric and mortar, but "we may have to ca on the government for special toolin and test facilities."

Hull feels any future expansio will follow the present pattern. Ne companies will be formed by "breal off" of personnel. "They will merg and re-amalgamate."

"There are amazingly few failures said Hull, pointing out that most ne companies are founded on know-ho in a specialized area of electronic He said he does not anticipate ar "radical expansion in any one area; a vancement of tubes and semi-co ductors probably will be balanced."

• **Ratio climbing**—The electron industry currently is devoting 52% its energies to military requirement In 1958 this translated into facto sales of $4.1 billion for military pro ucts and $3.8 billion in industrial ar consumer goods.

Increasing demands from the mi tary, EIA believes, will shift the rat to 60-40 by 1965, with missiles a counting for most of the difference.

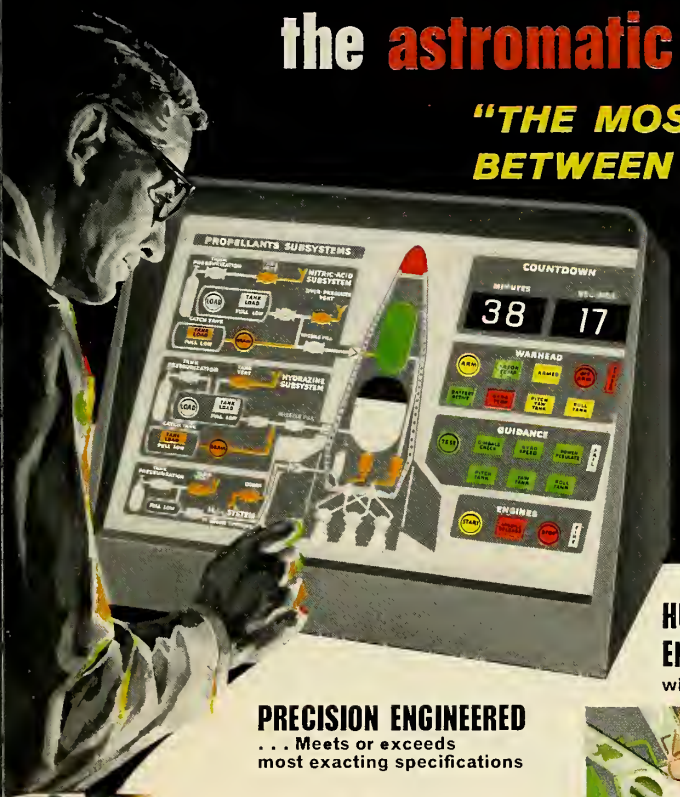
Pentagon procurement officials s their figures bear out the fact that ele tronics companies are getting a bigg and bigger share of the defense budg dollar. At present, 11 cents of eve DOD dollar is spent on some electron component or service, and out of eve "hard goods" dollar, 28 to 29 cen goes into electronic equipment.

In addition to missiles, this expen ture covers everything from walki talkie to wholly-transistorized compu ers for SAGE supercombat centers a giant radar dishes for BMEWS.

The actual number of componen produced by the industry for miss systems alone is staggering. It runs in the hundreds of thousands—from 35 ton *Talos* fire control systems to mini ture components so small that 600,0 may be crammed into a density of o cubic foot.

• **Challenges**—Hand in hand wi the exploding technology and expa sion of the industry is the creation new opportunities in both the milita and civilian markets. Missiles offer t greatest challenge.

Right now Hull says there is a ne for the industry to come up wi smaller, more complex and more re able test devices for system checko



ELECTRO SNAP

Creators of over 6,000 Precision Switches and Controls

presents . . . A new panel concept that promises to revolutionize monitoring or control of Missiles and Rockets

the astromatic panel concept

"THE MOST EFFICIENT LINK BETWEEN MAN AND MACHINES"

Consider These Obvious Advantages in Your Designing

- OFFERS INSTANT VISUAL CONTROL WITH EXTREME ACCURACY
- REDUCES HUMAN ERROR TO AN IMPROBABILITY
- PROVIDES SIMPLIFICATION OF THE MOST COMPLEX OPERATION
- ALLOWS REMARKABLE CONSERVATION OF VITAL SPACE
- WITHSTANDS EXTREME LIMITS OF TESTING SPECIFICATIONS
- APPLICATION POSSIBILITIES AS UNLIMITED AS THE IMAGINATION

HUMAN FACTOR ENGINEERED for highest efficiency with extreme accuracy

100% FLUSH PANEL . . . Eliminates protruding hardware . . . unless specified by human engineering requirements. Switching functions may be recessed, flush, or overflush.

TRI-COLOR LIGHTS . . . Each light module contains separate bulbs and circuits to permit three distinct color indications.

VERSATILE SWITCHING . . . Momentary, positive feel and alternate action switching is available.

LIMITLESS COLOR COMBINATIONS . . . Versatile TRILITES plus multi-color photo printing of panel allows unlimited color guidance.

SCHEMATIC DIAGRAMMING . . . Eliminates the written word. Increases speed and efficiency of operators and recognition of indications.

PRECISION ENGINEERED . . . Meets or exceeds most exacting specifications

SHOCK AND ABUSE TOLERANT . . . Laminated Fiberglas and aluminum eggcrate construction of front panel very rugged.

LASTING LEGIBILITY . . . Vivid colors actually photoprinted. Legend and diagrams will not chip or scratch off . . . meets all requirements of MIL-P-7788.

EASY TO ALTER . . . Legend and diagramming can be changed to visualize any new findings.

QUICK LAMP REPLACEMENT . . . Panel hinged for access to subpanel components permitting 10-sec. lamp change.

CONCENTRATED GROUPING OF CONTROLS . . . Multiple function of TRILITE controls saves two to four times space required by ordinary panel.

VERSATILITY OF DESIGN . . . The module concept of construction makes the Astromatic panel technique extremely versatile. WHATEVER ACTION YOU DESIRE TO VISUALIZE, ASTROMATIC CAN SUBMIT A PANEL DESIGN TO SURPASS YOUR EXPECTATIONS.

GE Offers New Micro-Modular Concept

Company claims eraser-size device named TIMM utilizes heat losses and lends itself to stacking for varied uses

PHILADELPHIA—A different concept of building several radio tubes and their circuits in one tiny, ceramic, stacked module for space electronics has been announced by General Electric Research Laboratory.

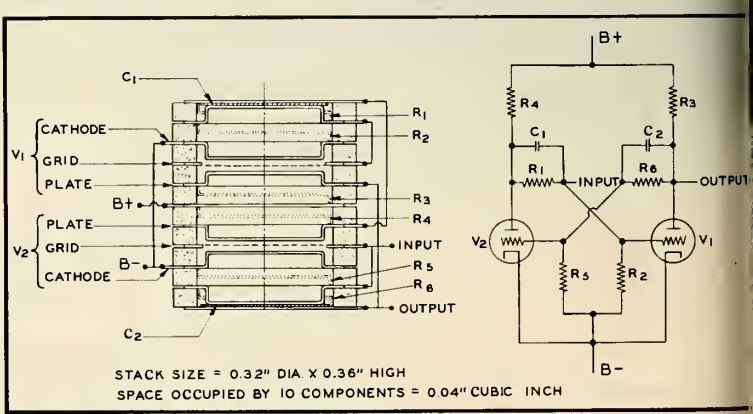
The laboratory has produced new devices called TIMM's, for "thermionic integrated micromodules." Instead of trying to eliminate the heat in tightly-packed electronic equipment, GE scientists have confined this heat and put it to work operating vacuum devices.

A complete circuit, such as an amplifier or multivibrator, occupies a space no larger than that of a pencil eraser, said GE. Operating at nearly red-hot temperatures, it takes full advantage of the high-frequency and reliability features of thermionic electron tubes.

• **New twists**—The design and operation approach embodied in TIMM's differs chiefly from other micro-modular concepts in that (1) tiny heaterless electron tubes are used instead of transistors, and (2) auxiliary cooling is reduced or eliminated and the heat losses generated within an equipment are utilized.

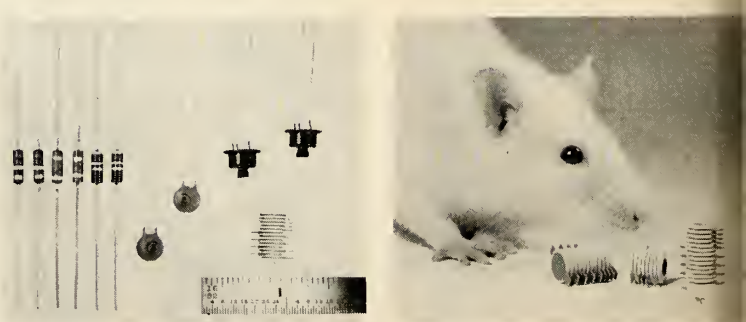
This serves the purpose of increasing the overall efficiency of operation and contributes to the extended life and reliability of the equipment. The TIMM's can be stacked, like building blocks, to provide a variety of electron circuit functions.

Resistors built into the ceramic modules consist of a resistive film on the inside of evacuated and sealed ceramic insulators. Laboratory reports indicate resistances of 5K per square are possible, and resistors made in this fashion of from 1 ohm to 500K have operated stably at 700°C.



The preliminary data have shown changes of less than 3% in resistance in an operating temperature of 550°C, and similar stability in operation within a nuclear pile.

Built-in microminiature capacitors, with synthetic mica as the dielectric, in operation have shown a change of less than 5% over a temperature variation ranging from zero to 700°C.



The heaterless electron tubes built into the stacks have a self-biasing characteristic—no grid current flows until the grid is at least two volts positive with respect to the cathode—thus eliminating the necessity for an external bias battery or a cathode-bias resistor and capacitor.

• **Component density**—A typic circuit module 1/3 inch in diamet and 2.6 inches in length can contain 1 diodes, 14 triodes, 14 resistors, and capacitors. This total of 44 compo nents yields an operating circuit den sity of 250,000 components per cubi foot. With different operating requir ments, densities of 1,000,000 compo nents per cubic foot are possible, sai the company.

A circuit function capable of 1(megacycle operation, selected as a

CROSS-SECTION and schematic diagram of a typical GE TIMM.

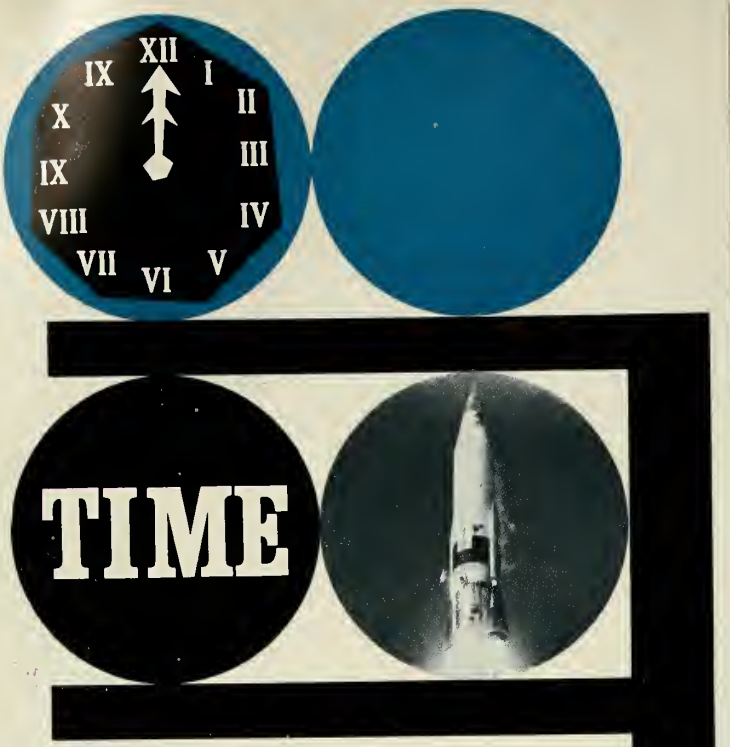
TINY CERAMIC micromodule (just above rule in photo at left and investigated b mouse at right) is less than 1/3 inch in diameter, can be stacked several inches. I comprises equivalent of conventional units shown in the left-hand photo.

suit-ability

FROM PHILOSOPHY — TO FEASIBILITY STUDY — TO DESIGN AND PRODUCTION

GENERAL ELECTRIC'S GROUND-BASED GUIDANCE SYSTEM FOR THE ATLAS MISSILE REQUIRED A COMPLETE MAINTENANCE TRAINING METHOD FOR MILITARY PERSONNEL WHO WOULD BE ENTRUSTED WITH THE UPKEEP OF THIS MODERN WEAPON. ERCO WAS SELECTED FOR THIS CRITICAL TASK.

ERCO TRAINING...TO FILL THE SUITS...TO SERVICE THE WEAPON



The requirements imposed by this intricate electronic problem were satisfied through unusually close engineering liaison, with appreciable economy and compressed schedules.

Time waits for no missile. At Cape Canaveral, where we assist the Air Force in management, operation and maintenance of the 5000-mile Atlantic Missile Range, time is our most demanding dimension. Countdowns must be completed, missile test schedules must be met, orbital interceptions must occur.

Everyday each member of our technical staff works against time to play an intimate, vital role in the nation's missile test and space exploration activities. Yet each man thrives, and in fact succeeds, by defying the time dimension — for nothing furthers an individual's career so much as meeting and successfully conquering crucial deadlines.

Certainly other ambitious engineers and scientists will find no more unique challenge for professional achievement than through an early appointment in the space age with Pan Am. If you are one such man, we invite you to investigate our career opportunities by addressing a brief resume to Mr. J. B. Appledorn, Director of Technical Employment, Pan American World Airways, Inc., Dept. B-8, Patrick Air Force Base, Florida.

PAN AM

Guided Missiles Range Division
Patrick Air Force Base, Florida

...missile electronics

example only, includes a pair of triple input "and" gates, a bistable multivibrator, and dual cathode follower outputs. It contains 30 parts and represents a circuit density of 250,000 components per cubic foot.

The circuit generates its own operating ambient temperature of 580 and requires less than ¾ of a watt of power from an external source. A comparable epoxy-encapsulated semiconductor version of the same circuit, capable of 5-mc operation and built by present methods, would contain 3 parts and with a circuit density of only 33,000 components per cubic foot would be limited in operation to a temperature range of minus 55 to plus 71°C.

• **Advantages**—GE believes the ceramic micro-modules make possible circuits which are smaller, lighter and generally require fewer components than their conventional encapsulated semiconductor counterparts.

Also, they seem to offer fewer temperature problems, higher reliability, longer life, greater ruggedness, resistance to nuclear radiation and higher operating speeds without sacrificing the signal power levels of their printed board or encapsulated predecessors.

In systems applications, their compactness should lead to improved electrical performance and greater efficiency through the useful application of circuit power dissipation, said a company spokesman. It also tends to reduce both weight and volume in systems where elevated temperature ambients are encountered.

The GE Receiving Tube Dept. in Owensboro, Ky., has announced that it already is planning the necessary applied research, development and production engineering procedures to make the devices, and engineering samples could be developed in a relatively short time. Production in quantity may be possible after another year, depending on the requirements of particular applications.

NCR to Research Photochromic Memory

HAWTHORNE, CALIF.—A one-year $90,000 contract from the Wright Air Development Center Aeronautical Research Laboratory for photochromic memory research has been awarded to the National Cash Register Company's Electronics Division.

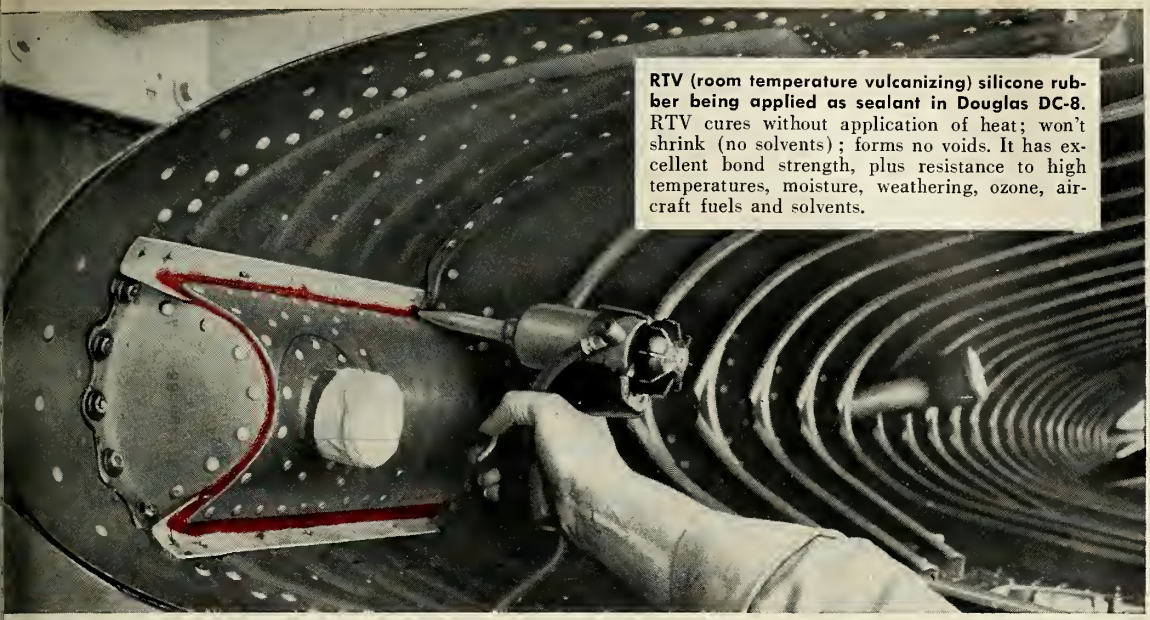
sulation technique developed by N research laboratories in Dayton, O in which a light-sensitive liquid dy stored in a gelatin capsule only millionths of a meter in diameter. cause the fluid has the necessary stable states for switching, the mic scopic chemical memory cell can st or give up information instantaneo in response to a beam of light. small size of the cells points computer memories of unpreceden density for airborne and spacebo applications, said NCR. It is belie possible to coat a square inch of with 1,000,000 of the capsules.

Eventual application of the resea findings will be in automatic cen control and data systems for high-a tude vehicles. The immediate goal i obtain all necessary data for a deta preliminary design of a feasibi model having optimum photochro memory. The program will be c cerned with simplicity of design, creased reliability, minimum rand access time, high storage density, weight, low power consumption, sensitivity to severe environmental c ditions, and low cost.

Unit Cools IR Gear to As Low As 60° K



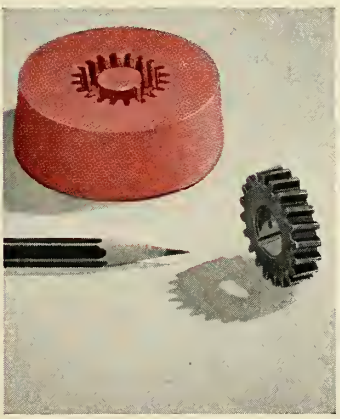
CAMBRIDGE, MASS.—A tiny coo device which super-chills infrared tection (IR) equipment to 60°K b new refrigerating technique has b developed by Arthur D. Little, I Cambridge research and enginee company.

The 8-ounce unit is the result the company's two-year research ject into extreme low-tempera equipment. Known as the min cooler, it will be shown at the Nati Missile Industry Conference (May 28) in Washington.

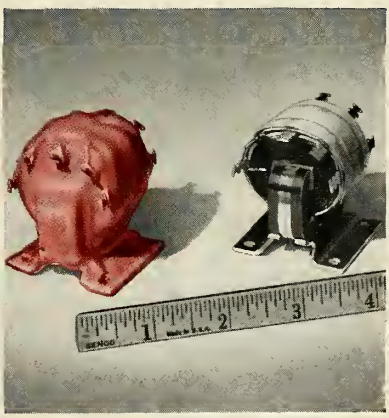
Believed to be suitable for airb operation in missiles or airplanes, current closed-cycle IR detection tem is designed to weigh less than pounds. Further development with new device is expected to reduce weight to less than 10 pounds, ADL.

In operation, helium gas expa from 300 psi in a ¼-inch-diam cylinder, 2 inches long. A tiny pl piston is the only moving part b room temperature. The cold end of tube refrigerates an IR cell to 6

Cooling IR detectors to extrem low temperatures increases their s tivity and makes them responsive a wider range of wavelengths. makes it possible to detect small ra tion differences between the "tar and its background.



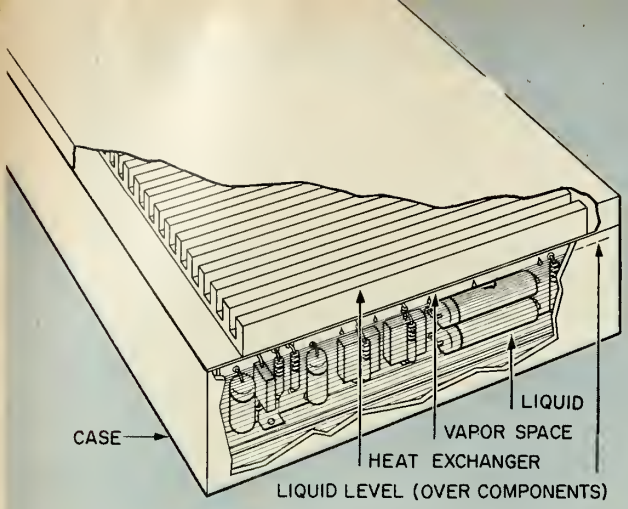
RTV (room temperature vulcanizing) silicone rubber being applied as sealant in Douglas DC-8. RTV cures without application of heat; won't shrink (no solvents); forms no voids. It has excellent bond strength, plus resistance to high temperatures, moisture, weathering, ozone, aircraft fuels and solvents.



G-E RTV silicone rubber—a superior material for tooling, encapsulating and sealing

rototype jet engine nose cone (right) cast n RTV mold. Epoxy parts cast in flexible TV molds have a bright, glossy surface and eproduce extremely fine detail. No parting gent is required for even the most complex arts. High tensile and tear strength is reained even after prolonged heat aging.

Close-tolerance, non-standard helix gear cast complete in low-cost, one-piece RTV mold. Previously such replacement parts had to be machined by hand. Now they can be quickly and inexpensively replaced by using the broken part as a master.



Potting and encapsulating of electrical components, such as this aircraft transformer, are easy with RTV. It can be poured, sprayed, painted or applied by dipping. Temperature resistant from −60°F to +600°F; excellent resistance to high altitude arc-over and corona. Comes in wide viscosity range.

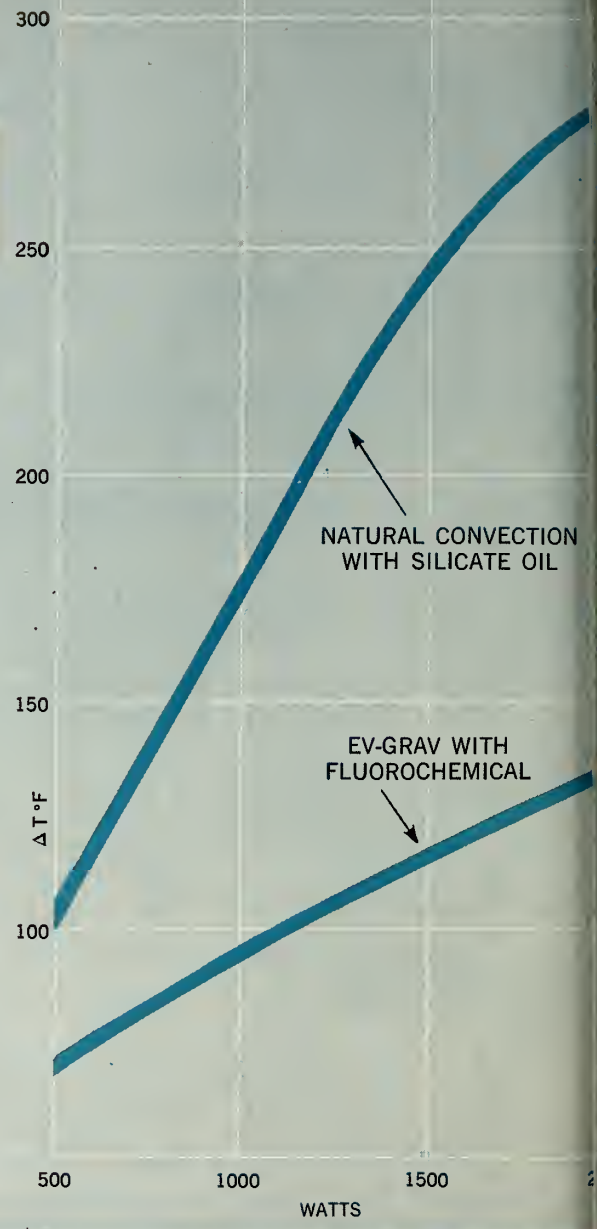
For application data and samples of General Electric RTV silicone rubber, write to General Electric Company, Silicone Products Department, Section 052, Waterford, N. Y.

GENERAL ELECTRIC

Silicone Products Dept., Waterford, N. Y.

In Raytheon's "EV-GRAV" system, liquid refrigerant boils off the surfaces of the individual electronic components, rises as vapor, condenses on the heat exchanger, and drops as liquid to repeat the cycle.

"EV-GRAV" COOLING



IN THE DESIGN OF HIGH HEAT-DENSITY ELECTRONIC EQUIPMENT

Performance requirements for electronic equipment in supersonic aircraft and missiles place particular emphasis on the need for more efficient heat transfer techniques.

The use of fluorochemical refrigerants in an "evaporative-gravity" cooling system is a novel method of removing heat from electronic components. The refrigerant boils at the surfaces of submerged heat-dissipating components and condenses on the surface of a heat exchanger at the top of the package.

This technique has proved more efficient than free convection in oil dielectrics or forced convection with gas dielectrics. The high dielectric strength of the fluorochemicals permits the achievement of higher density packaging.

Contributions such as this are typical of the Heat Transfer Group in Raytheon's Government Equipment Division . . . assisting design engineers in developing the complex weapons systems of tomorrow.

PROFESSIONAL ASSOCIATION WITH A FUTURE

U.S. Seeks Ways to Close Translation Gap

by James Baar

WASHINGTON—Hundreds—possibly thousands—of scientists working on U.S. space and missile programs are wasting their time. Much or part of the work they are doing already has been done by Russians . . . or Czechs . . . or Red Chinese . . . or other Iron Curtain scientists.

Moreover, the Iron Curtain scientists have published papers on their work. But their American counterparts may never know about it. The papers may never be translated. Or, if they are, the Americans may never see them until too late—if at all.

The solution to the problem may be a new Spage Age weapon: The electronic translator.

Or it may be a far broader coordinating and distribution system for what already is being translated. Or it may be a long-range Russian language training program. Any one of these would cost millions but America's missile industry can provide the ingenuity.

The House Space Committee within the coming weeks will hold a series of hearings to determine the scope of the problem and what ought to be done. Most experts will tell the committee that the problem is very great. But, they disagree as to the solution.

• **Soviet lead**—The Russians began a mass attack on the problem of translating foreign scientific literature in 1952 with establishment of the All Union Institute for Scientific and Technical Translation (VINITI).

It has a full-time staff of 2300 editors, publishers and assorted experts who screen the world's published scientific output. They draw on some 2,000 Russian scientists to translate and abstract scientific papers and books.

VINITI publishes the vast *Referativnyi Zhurnal* which provides Russian scientists each year with almost a half-million abstracts of scientific works—2% from outside the Soviet Bloc. The sections of the *Referativnyi* divided according to field are distributed throughout Russia. Full translations are provided by VINITI on request.

Besides VINITI, Russia also has three other types of organizations abstracting, translating and distributing foreign scientific material. However, VINITI acts as a centralizing point for most of the other abstracting services.

The speed with which the Russians translate and distribute foreign scientific papers varies greatly.

U.S. experts say many Russian scientists complain that sometimes they don't see a translation until more than a year after publication of the original article.

However, the Russians also provide an extremely rapid express service for articles and books considered to be of top importance. Such an article may be translated and put in the hands of a Russian scientist in Moscow one or two weeks after its original publication in New York.

• **Steps taken**—The United States within the last year has made two major steps toward improving the translation, coordination and distribution of scientific literature of Russia and other Soviet Bloc nations.

The National Science Foundation in December established the Science Information Service to help make foreign scientific literature more readily available to Americans through a variety of programs.

One of the main roles of the Foundation in carrying out the program is the subsidization through grants of more than 20 societies and universities for cover-to-cover translation of 35 of the most significant Russian scientific journals.

Meantime, the U.S. Office of Technical Services has undertaken a broad program of selling translations of Russian scientific work made by all government agencies. These include translations of the Soviet *Referativnyi.*

Among other OTS offerings are:

• Bi-monthly lists of translations of Russian scientific material available from government agencies or private translating firms.

• Abstracts of about 140 Russian journals.

OTS expects to provide abstracts of more than 170 Russian journals by the end of the year. It also expects to provide abstracts of about 30 Red Chinese journals.

At present, OTS is spending about a half-million dollars a year on its program. National Science Foundation is spending more than a million.

Finally, considerable quantities of Russian translating are being carried on throughout the country by private industry. Much of this is never distributed beyond the firm doing the work in order to avoid tipping off competitors as to what the firm is working on.

In all, Science Information Service officials estimate that the United States is doing about as much translating as Russia. Also, they say about the fastest translating jobs being done in the United States take about five months—although as in Russia there are exceptions.

"Where we're behind," one expert said, "is in distribution. It's harder for the average scientific working staff to find and get the stuff in the United States."

Moreover, the United States is behind in another vital area: reducing the need for translations.

More and more Russians today speak English. They begin studying a foreign language in the first years of school. The language they most often choose is English.

On the other hand, only about 2 per cent of U.S. scientists read Russian.

• **Electronic help**—One of the most hopeful immediate solutions is the possibility of developing electronic translators out of huge computers. Study programs at a half-dozen American universities have shown that the idea is promising. And the Machine Translation Research Project at Georgetown University already has claimed a reasonable degree of success with an IBM 704 computer.

Georgetown research workers have been able to translate both French and Russian texts at a rate of three words a second. They expect far better results with the much faster IBM 709 and 7090.

However, they say the principal drawback in computer translation today is the cost of having the foreign text punched on cards, making the entire operation more expensive than human translating.

"What we need to develop is an electronic scanner or reading machine," one said. "Then we'd have something."

Some officials say the best approach to the whole translating problem probably would be twofold: perfection of the electronic translator plus a Russian language training program.

They say this would solve both the problem both for the present and the future. And they stress that the problem must be solved as quickly as possible.

As one Russian-speaking expert put it pointedly: "Rossiya dumayut! (Russia is thinking!)."

ABMA Receives First of *Saturn* Engines

Jupiter test stand being modified to accommodate cluster of Rocketdyne H-1 liquid engines

HUNTSVILLE, ALA.—The Army Ballistic Missile Agency has received the first of eight Rocketdyne H-1 liquid engines which will be clustered to produce 1.3 million pounds of thrust and has already begun modifying a *Jupiter* test stand for static tests here.

The entire project, dubbed *Saturn*, is on schedule, project officers say. But they have yet to name a date for first tests. Since *Saturn* is due to be flight-tested at Cape Canaveral in 1960 it is entirely possible that the first static tests may be made sometime this fall.

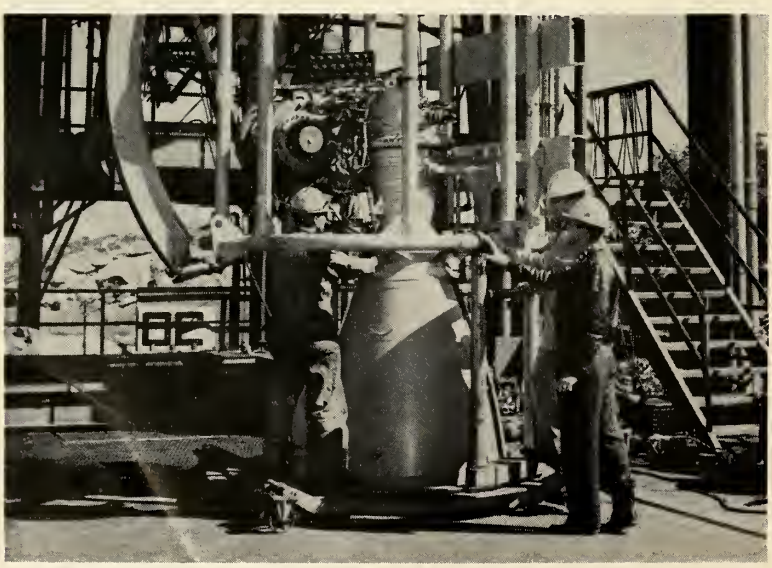
The H-1 engine is a refinement of the device now powering both the *Thor* and the *Jupiter* IRBM's, somewhat more compact and probably slightly smaller. Components were repackaged to achieve better grouping and the turbopump is slung "side-saddle" on the thrust chamber in contrast to its former position on top of the chamber.

Each of the eight clustered engines, will, of course, have its own turbine. LOX and RP-1 will be supplied from a common fuel tank, a combination of present *Redstone* and *Jupiter* frames.

• **Departures**—Contrary to previous speculations, the engines will be clustered in a circle, with each engine gimballed separately and possibly in staggered depth. Provision is made for jettisoning the booster engines—with recovery by parachute a later development.

The engines are hypergolically ignited. Safety devices which will be built into *Saturn* include a provision that all eight engines must be functioning normally before the missile can be released, and compensating factors to keep the missile on course should one or even two of the engines fail during flight.

It is believed that the more compact H-1 engine will also produce a greater thrust, probably from 180,000 to 190,000 pounds, producing a combined total of the 1.3 million pounds desired. The big booster is intended to lift into satellite orbit loads of some 20,000 pounds. Under its present design, the cluster will be so high that it cannot be assembled in ABMA's "fab lab" where such work is normally done. It would almost touch the ceiling cranes necessary to move it.



In September ABMA was authorized by the Advanced Research Projects Agency to develop the super booster. During the same month, Rocketdyne received the contract from the Army Ballistic Missile Agency to develop the basic engine. ARPA said that the cluster concept has been uti… because of the proven "extreme … ability of the Rocketdyne engine."

The entire *Saturn* system, wh… enters flight test in 1960, will an… the nation's urgent demand for q… relatively inexpensive, reliable del… of an extremely high-thrust bo… capable of lifting into satellite orb… outward to space journeys, a mul… load of instrumentation. The thrust … be nearly four times that of the nat… currently most powerful flight-te… propulsion system, the *Atlas* IC… cluster of engines.

No details of the overall config… tion of the *Saturn* space vehicle … been released, but in other multi-s… rocket powered vehicles the boost… jettisoned after operating for the … grammed duration, permitting the … per stages and instrumentation to … tinue on the space journey. Parac… recovery of the booster is under st…

The start sequence is the sim… yet provided in the family of Roc… dyne engines. Safety devices have … built in; one of the safety factors is … assurance that all eight engines … function normally before the mi… can be released.

Hypergolic ignition (self-ignit… will further increase the reliability … the H-1. Combustion within the th… chamber occurs above 500°F.

THE FIRST of eight H-1 Rocketdyne engines arrives at the Army Ballistic Missile Agency for clustering into Project *Saturn*.

Army Redesigning Air Supply Tank for *Corpora*…

LOS ANGELES—The Army will … a redesigned internal air supply t… for the *Corporal* and other miss… which eliminates multi-cell struct… characteristics.

The tank, developed by the F… stone Tire and Rubber Co. guided … sile division here, is called a "… cell." It is comprised of two half-sh… joined longitudinally and welded … 30-inch-diameter hemispherical dra… heads.

Fabrication costs of the steel … cell are estimated at about 50% … multi-cell construction. Weight will … reduced by about 50 pounds.

In redesigning the tank, Firest… says it considered increased safety … operating personnel, cost reducti… improved reliability and higher prod… tion rate.

letters

(ptik' or 'Vel'?

the Editor:

I have read Maj. W. C. Mannix's ar- ie on the "optik" (M/R, April 27) h considerable interest and applause. I solicitation for comment prompts me uggest a velocity unit based upon the pe velocity which, for earth consider- ns, approximates 7 miles per second. monosyllabic term "vel" could be l to denote this equivalence.

Unlike the optik, the vel does not have advantage of being absolute. How- , the vel would seem to have a flex- ty and convenience not shared by optik. For example, the Mach unit proven to be useful since it is asso- ed with and automatically defines cer- aerodynamic phenomena. By the e token, the vel would automatically ne certain astronautical characteristics. earth considerations, this table depicts relationship between a space vehicle's rt, orbital velocity at perigee (in vel s), and orbital eccentricity:

Units	Eccentricity	Orbit
ut 0.7	0	Circular
veen 0.7	less than 1	Elliptical
1		
1	1	Parabolic
ter than 1	greater than 1	Hyperbolic

As a matter of interest and informa- , the following equivalences are slide approximations:

	miles/ hour	feet/ sec	einsteins (roemers)	optiks
illivel	25.2			
l	25.2×10^{3}*	37.0×10^{3}	3.76×10^{-6}	37.3
lovel	25.2×10^{6}			

(*By coincidence, this figure yields a nor convenience in that it approxi- es the earth's circumference in miles.)

ec Writers Defended

the Editor:

After reading your editorial "Six Lines o the V-2" in the March 23 issue, I e that it could not be let pass without ie comment on my part, specifically because I have a background in both industry and government.

The editorial unfortunately conveys the impression that:

a. Government specifications are written arbitrarily by people not as "realistic" as industry engineers.

b. A manufacturer will provide an optimum piece of equipment on a government contract regardless of availability of previous tooling, availability of components, engineering time etc.

Having observed and operated on both sides of the fence, I have found that both of these are dangerous generalizations. In most cases, military equipment specifications are written by an engineer who has considerable background on the equipment for which the specification is being written. He also has a reasonably good background on the applicability of the various new types of components. Many engineering reports on research contracts are available to him to help him keep his specifications realistic. These reports are seldom immediately available to industry.

In my opinion, the engineer writing military specifications is probably closer to the equipments than most of the contractors who bid to manufacture the equipment. He must consider having to "live" with the equipment for many years and must be "realistic" in both his specification and the design for which he must give final approval. Because of these facts, I believe the government engineer must be at least as realistic as his industrial brother.

As to point b., it is quite obvious that a manufacturer is not in business as a philanthropic organization—he must make a profit. He is required by contract to meet only the minimum requirements of the specification. He would be a poor businessman indeed to discard previously developed tooling, engineering and components if they could be used on a new equipment with a minimum of change. This approach, while good business, does not lead to improvement of equipment by application of new techniques, ideas and components.

I would suggest that you investigate the difference between a research and development contract, an applications engineering contract and a production contract. I believe that you would find that spec. writers are as flexible as the situation allows insofar as the use of components, new designs, etc., is concerned in both R&D and applications engineering. In production there is very little allowance for flexibility . . .

Miscredit

To the Editor:

I am writing in regard to the article: "Story Behind The Death of a Missile" which appeared in your May 4, 1959, issue.

I note that the photograph facing the first page of the article is credited, by implication, to your photographer, Mr. Cornell Capa. This photo illustrates the actual explosion of the Convair missile in the test stand at Edwards Air Force Base.

I wish to state that I am the photographer who took the picture at great personal risk and I feel that crediting this photo to another photographer, by implication or any other means, is a gross violation of existing ethics.

Allen D. Rice
1209 W. Milling St.
Lancaster, Calif.

Our apologies to the Air Force, which released the picture, and to Photographer Rice. Cornell Capa was, of course, taking pictures in the blockhouse at the time of the explosion.

Suggestion Box?

To the Editor:

Your editorial of May 4th and the statement by Dr. Walter Dornberger on page 30 touch on two aspects of one idea. The editorial points out that since every *Minuteman* missile will need a hole in the ground 100 feet deep, the military is looking for a more efficient and economical way to do it than by present methods. You quote a Pentagon official predicting that if a solution is found it will probably come from "a little guy with an idea."

In the profile on Dr. Dornberger, he is quoted as speaking up for a financial slice for the scientists who come up with ideas: "Creative thinking and imaginative engineering should be paid for . . . the government should guarantee a share in the profit of later production for the original creative mind."

Occasionally some obscure "little guy's" idea does get used, but the lack of a channel for submitting ideas is still a major problem. Why not marry the two concepts above with a missile problems program based on the breakfast food contest idea? They set out a problem, state their rules, tell where to submit, when it will be judged and the reward.

It seems to me that Missiles and Rockets is in a position to arrange such a plan on missile problems. You are in closer contact with military leaders—which is the first obstacle for the "little guy." You might even be able to act as receiving and forwarding agency for submitted problem solutions suggested. The military agency could be contest judge.

What do you think?

VEST POCKET POWER

From vest-pocket nuclear generators for ocean, arctic and wilderness stations—or satellites and space systems—to portable power reactor systems meeting the large-scale requirements of military installations, the products of Martin's five-year nuclear development program are now making news... Developed under the direction of the AEC, the pint-sized 4-pound Martin SNAP III thermo-electric generator was recently singled out for commendation by the scientific community. Meanwhile, Martin is at work on a portable nuclear power plant, designed for transport by air, to provide power and heat for an Air Force installation at Sundance, Wyoming.

contract awards

AIR FORCE

$29,300,000—**General Electric Corp.,** for further development of the J93 jet engine. (This is in addition to the $8,300,000 contract previously announced.)

$510,000—**United Enterprises, Inc.,** New Orleans, for construction of an assembly hangar at Cape Canaveral for the *Mace* tactical missile.

$350,000—**Burroughs Corp.,** Detroit, for coordinating data on transmitting set compatibility to Montgomery sector radars.

$326,500—**General Electric Corp., Defense Electronics Dept.,** Syracuse, N.Y., for miscellaneous telemetric components.

$170,700—**Douglas Aircraft Co., Inc.,** for technical services.

$151,300—**General Motors Corp., AC Spark Plug Div.,** Milwaukee, for technical services.

$131,500—**North American Aviation, Inc., Rocketdyne Div.,** for technical services.

$83,093—**Hallamore Electronics Co., Div. of Siegler Corp.,** Anaheim, Calif., for data insertion converter rack.

$64,815—**Bendix Aviation Corp., Freiz Instrument Div.,** Towson, Md., for miscellaneous replacement parts for airborne weather equipment, radiosonde receptor and radiosonde dispensing sets.

ARMY

$6,462,384—**Independent Contractors & Engineers,** Dallas, for construction at the *Atlas* site, Forbes AFB, Topeka, Kan.

$3,370,000—**Douglas Aircraft Co.,** Santa Monica, Calif., for launching equipment for the *Nike-Hercules.*

$1,442,315—**Industrial Metal Fabricating, Inc.,** Wayne, N.J., for 500 prefabricated buildings.

$1,375,010—**General Electric Co.,** for generators.

$777,886—**Douglas Aircraft Co., Inc.,** Santa Monica, Calif., for launching items (four contracts).

$510,618—**Rheem Mfg. Co.,** Downey, Calif., for fuzing system for warheads (two contracts).

$450,000—**Firestone Tire & Rubber Co.,** Los Angeles, for modification of guided missiles.

$180,499—**Harvey Aluminum,** Torrance, Calif., for study of weapon systems.

. . . contract awards

$169,512—**Data Instruments Division, Telecomputing Corp.,** for fixed camera reader.

$74,886—**Gilfillan Bros., Inc.,** Los Angeles, for repair parts.

$56,419—**Ordnance Engineering Associates, Inc.,** Chicago, for testing including thruster XM-11 PMTS, cartridge and load assembly.

$46,651—**Hufford Corp.,** El Segundo, Calif., for spherical heads.

$46,047—**Librascope, Inc.,** Glendale, Calif., for tape cartridge memory system.

$38,205—**Airtemp Div., Chrysler Corp.,** Dayton, Ohio, for engineering orders applicable to ballistic missiles.

$30,000—**University of Utah,** for investigation of chemical reactions.

NASA

$175,000—**Callery Chemical Co.,** Pittsburgh, for evaluation of a new classified solid-liquid rocket propellant.

$135,480—**Consolidated Electrodynamics Corp., Datalab Div.,** Pasadena, Calif., for design and development of airborne magnetic-tape recorders to monitor the first manned orbital space flight under Project *Mercury* (a subcontract from McDonnell Aircraft Corp.).

(The instrumentation will record physiological reaction of the pilot and monitor environmental conditions of the McDonnell space capsule.)

(Because of military applications, NASA scientists said only that the propellant was of a new non-cryogenic type that would permit substantial increase in payload weight. Callery is expected to explore feasibility of the new concept, which has both liquid and solid applications, and report its findings to NASA in about eight months. A major subcontractor in the evaluation is **Reaction Motors Inc.,** of New Jersey, a division of **Thiokol Chemical Co.**)

$46,000—**Space Electronics Corp.,** Glendale, Calif., for a study of requirements for the proposed Project *Mercury* control center.

(The center will serve as the basic decision-making facility of the project's world-wide range of tracking, telemetry and computation centers. A scale model of the center will be developed under the contract, and requirements and specifications for the center's equipment will be assessed.)

Fellow Engineers and Scientists:

My company has asked me to tell you of the unusual opportunities in operations research at System Development Corporation. These range from positions for engineers and scientists who would like to develop their skills working in a team under an experienced leader to opportunitie for those who are looking for positions of leadership. I hope that the following account of our work will lead you to inquire for further informat

Briefly, SDC's business is automated decision-making systems. More fully, we develop large scale, computer-based information processing systems in which the computer is used as an on-line, centralized control element for a system operating in real-time. At this stage of the art these systems are semi-automatic, the man-machine type in which man shares the repetitive control function with the computer. Our work is concept-oriented, rather than hardware-oriented, and deals with problems of over system design, data processing development, and man-machine system training.

The most fully developed large-scale semi-automatic system is the SAGE (Semi-Automatic Ground Environment) Air Defense System. We have a major responsibility in the development of SAGE. Our experience and unique team skills have led to diversification of our activities; we no have important contracts for other major military and government system vital to our country. The demand for our services is reflected in our grow from 70 to more than 2,700 employees since 1955, and the intriguing possibilities of automated decision-making are only beginning to be reali

In this brief message, I can only suggest the variety of operations research problems at SDC. Perhaps the most important point is that this variety is limited only by the imagination and initiative of our scientists.

Some examples of areas of work are: (1) allocation of decision-making functions between man and machine for optimal system performance; (2) measures of system capacity and system performance; (3) explorati and evaluation of design changes by operational gaming; (4) quality cont and testing of operational computer programs; (5) allocation of compute capacity among several system functions; (6) scheduling and costing of production of operational computer programs; (7) optimal assignment of mixed weapons to targets.

SDC recognizes the importance of a well planned research program fo the vitality and future of the company, and we are carefully organized to carry out such a program. The following are some areas our operations research people are involved in: (1) simulation and operational gaming techniques in problems of control systems; (2) information retrieval and theory of information processing; (3) medical data processing; (4) univer language for computer programming; (5) logistics. We have unusual facilities for research at SDC—these include one of the largest compute facilities in the world and outstanding simulation laboratories.

We have given considerable thought to organizing the activities at SD provide for professional development and self-expression. Operations research professionals are carefully assigned so that their individual talents are matched with company needs. These assignments are review regularly to make sure that developing talents are directed into new company opportunities. We regard the publication of research articles a participation in professional societies as activities important to the company. We encourage new ideas and provide the time and means to explore them.

SDC is one of the leaders in a field which will have a remarkable technological and scientific development. It is a new and vigorous comp with a bright future. I encourage you to join us.

Please write Mr. R. W. Frost at the address below if you wish to purs this invitation.

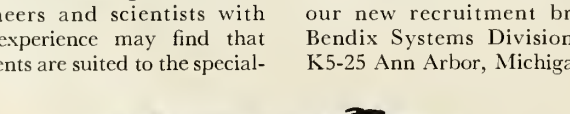
QUARTERBACKING THE EAGLE PROJECT

Bendix Aviation Corporation will be prime contractor for the Eagle missile—and Bendix Systems Division will quarterback the project.



Latest in a series of important defense projects to be assigned Bendix Systems, the Eagle will be a long-range, air-to-air missile designed for fleet air defense and interception missions.

Responsible for systems management and engineering in connection with the project, Bendix Systems Division will also direct the development of the Eagle missile, electronic guidance, and fire control equipment in the launching aircraft.

Engineers and scientists with missile experience may find that their talents are suited to the specialized work involved in the Eagle project and other important system programs at Bendix Systems Division.

Located adjacent to the Engineering campus of the University of Michigan, Bendix Systems Division offers the better man an outstanding opportunity to join an organization with full facilities for encouraging his finest work. Ann Arbor is a wonderful place to live and raise a family, a town which combines life in a college community with the nearby advantages of a large city.

If you are interested and qualified in weapons system planning, research and development, write today for our new recruitment brochure. Bendix Systems Division, Dept. K5-25 Ann Arbor, Michigan.

POMONA, CALIFORNIA

*Wholly owned subsidiary of Central Hadley Corporation — listed American Stock Exchange.

The House has passed (294-128) and sent to the Senate a $480 million authorization bill for NASA. The measure does not carry any appropriation.

High-strength steel sheets from .005 to .100 inches thick and up to 125 x 240 inches in size are being evaluated at request of Air Materiel Command by 16 propulsion and missile/aircraft manufacturers. Aerojet-General and National Northern will apply series of explosive forming techniques to determine if sheets can be deep drawn for missile applications.

NASA contracts for April amounted to $27.6 million—the largest $24 million to Douglas Aircraft Corp., for three stage launching vehicle *Delta*. Other contracts went to: MIT, $50,000, for the development of a cesium vapor atomic clock, and gamma ray detection instruments; University of Maryland, $60,000, to investigate the forces between atoms, molecules, and ions; Itex Corp., $170,000, for development of upper-atmosphere sounding rocket instruments; New York University, $100,000, to instrument two *Aerobee-Hi* rockets for neutron intensity measurements; AOMC, $150,000, radiation satellite payloads; Univ. of Chicago, $300,000, to build cosmic ray measuring instruments; General Mills, $60,000, for nine 100-foot diameter plastic balloons for communications satellite tests; RCA, $60,000 for *Mercury* ground tracking and instrumentation studies; American Potash & Chemical Co., $50,000, for 161,000 pounds of ammonium perchlorate for solid research; rensselaer Polytechnic Institute, $80,000, for mathematical investigation of control systems; and Rice Institute, $150,000 for wind tunnel studies and research into physics of solid materials at high temperatures.

Lockheed Aircraft is moving into the missile electronics field with the acquisition of Stavid Engineering Inc., Plainfield, N.J. Terms are 2½ shares of Lockheed stock for every share of Stavid. No changes in management or policies of the smaller firm, which has 1000 employes and 1958 sales of $11.2 million, are contemplated. Stavid co tracts have covered scale model launc ing, silo instrumentation for *Minu man*, airborne radar beacons for t *X-15* and guidance and controls f several other weapon systems.

Labor troubles have hit the miss ranges. An *Atlas* shoot at Vandenbe AFB was delayed by a May 18 wal out of machinists protesting Conv living allowances. On the same d there was a double failure of an *Ati* and a *Polaris* during a work stoppa by carpenters at Cape Canaveral.

Test stand at Martin's Denver pla was severely damaged May 15 explosion of *Titan* first stage. No pe sonnel injuries were reported and t missile's second stage, only 10 fe away at the time, also escaped u scathed.

Air Force is now investigating Ra theon's proposed "sky station"—dis shaped structure to be kept aloft b beaming high-powered microwave e ergy to run mechanical rotor. Key ite is amplitron microwave tube whi eliminates need for bulky reflectors a power converters. Potential early app cations are missile and aircraft dete tion, skypath link for long-range, larg capacity communications and meteo ological observation.

Space Recovery Systems Inc. is b ing formed by the Columbia Broa casting System jointly with Steinthal Co. Inc., a parachute R&D and man facturing concern. The new ventu will specialize in equipment to trac locate and recover missile and spa vehicle components and payloads.

Name changes: Yielding to th Space Age, Aircraft Industries Assoc ation has switched to Aerospace Indu tries Association. Henceforth CD Control Services Inc., Hatboro, Pa manufacturer of advanced compute integrated electronic controls, wish to be known as the CompuDyne Cor And stockholders of Mid-Century In strumatic Corp., New York City, ha voted a change to Computer Systen Inc.

What makes plastics crack? Th Wright Air Development Center h awarded a $28,000 contract to Brool lyn Polytechnic Institute to find out particularly on plastics subjected space flight conditions.

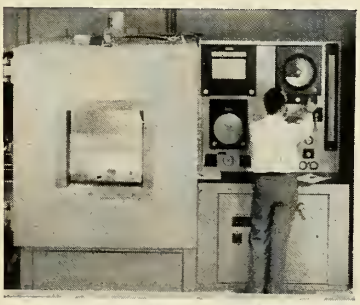
, of course, the development of a
l management team—the most ele-
tary of all—sometimes takes years.

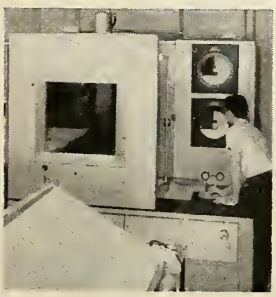
ENVIRONMENTAL TEST CHAMBERS FROM THE CONRAD Inc. FILE



THE INQUIRY FROM THE CUSTOMER

Sometimes we build chombers to our own design, sometimes to customers' specifications. Here's o case of the latter. Hermetic Seol Tronsformer Co. sent us their stondard inquiry forms and specificotions for three chambers — temperoture-humidity, temperoture-oltitude, and temperoture. Conrod's engineering ond estimoting deportments took over, without obligating Hermetic in ony way.

THE RESULT FROM CONRAD, INC.



Conrod's product, performance, ond pricing looked right to Hermetic. These three chombers are now key units in Hermetic's up-to-the-minute environmental test loboratory, enabling them to mointain o complete check on prototype ond production models of their products. These focilities ore olso avoiloble for testing products of other manufacturers.

FH 36-5-5 TEMP.-ALT. — Temperature range —100°F. to +500°F., altitudes to 200,000 ft. (from atmospheric to 150,000 ft. in 11 minutes).

CB 8-2-2 TEMP — Electrical units may be operated within this chamber at temperatures from —100° to +250°F.

FO-36-2 TEMP.-HUMIDITY — From —35°F. to +250°F., up to 98% relative humidity. Temperatures stabilized within 2°F.

MAGNETOHYDRODYNAMICS
EXPANDING THE FRONTIERS OF SP

MAGNETOHYDRODYNAMICS: Lockheed's 3rd Annual Symposium* on this important new field—which deals with the behavior of conducting fluids in magnetic fields—attracted physicists from all over the world. As portrayed by the artist, man's earliest experiments with magnetic forces involved the use of the ancient lodestone. Solar prominences are a dramatic example of such forces under investigation today.

Lockheed Missiles and Space Division has complete capabilities in more than 40 areas of science and technology—from concept to operation. Headquarters are at Sunnyvale, California, on the San Francisco Peninsula, with research and development facilities located in the Stanford Industrial Park in nearby Palo Alto and at Van Nuys in the San Fernando Valley of Los Angeles. A 4,000 acre, company-owned test base, 40 miles from Sunnyvale, conducts all phases of static field testing. In addition, complete flight testing is conducted at Cape Canaveral, Fla., Alamogordo, N.M., and Vandenberg AFB, Calif. as an integral part of every stage of missile and space programs at Lockheed.

The Division's advanced research and development programs now under intensive study provide a fascinating challenge to creative engineering. These programs include: man in space; space communications; electronics; ionic, nuclear and solar propulsion; magnetohydrodynamics; oceanography; computer research and development; operations research and analysis; human engineering; electromagnetic wave propagation and radiation; materials and processes and others.

HNOLOGY

Lockheed's programs reach far into the future and deal with unknown environments. It is a rewarding future which scientists and engineers of outstanding talent and inquiring mind are invited to share. Write: Research Development Staff, Dept. E3-29, 962 W. El Camino Real, Sunnyvale, California. U.S. Citizenship required.

"The organization that contributed most in the past year to the advancement of the art of missiles and astronautics."

missile business

by William E. Howard

Anemia, insofar as the Defense Department is concerned, apparently is no cause for alarm. Missile makers must show acute starvation before the Pentagon will even consider changing the policy line it adopted toward profits in 1957 and still does today.

Precisely what the profit factor should be when doing business with the government is one of those questions not easily resolved. As matters stand now, the government holds virtually complete control. And its decision is to keep profits as low as possible, regardless of the fact that the economic health of its suppliers is critically important to the defense effort.

In essence this is the DOD position set forth for a House Appropriations subcommittee recently by Perkins McGuire, Assistant Defense Secretary for supply and logistics. The aircraft industry early last year asked for a higher profit factor. It said the money was needed to expand industry's research and development facilities for defense. "The Department gave this recommendation considerable study," McGuire said, "which resulted in our conclusion that our profit objective for the industry as a whole was not too low considering all of the factors under which the industry operates."

The assistant secretary's statement left unanswered in the text the question of whether the R&D effort might be too low. Industry spokesmen have long claimed that R&D—particularly basic research—is underfunded. Many companies admit they are skimping their stockholders to put all the money they can into R&D now, and it still isn't enough.

Interestingly, McGuire's statement was accompanied by some figures from the Air Force graphically indicating the profit-shrinking trend. The Air Force compiled published financial statements of Boeing, Douglas, Lockheed, Martin, McDonnell, North American, Northrop and Republic. It found the profit ratio on sales before taxes had slipped from 4.9% in 1957 to 4.1% in 1958 and after taxes the ratio was 2.45% in 1957 and 2.02% in 1958. The Air Force estimates the 1959 profit ratios will be the same as last year.

Reporting on another industry recommendation to increase the return on DOD R&D cost-plus-fixed-fee contracts, McGuire told the lawmakers that a study showed these fees: Army—4 to 9% with most less than 7%; Navy—token fee of $1 to a high of 10% with the average about 6.5%; ARDC—4 to 10% range with the average 6.1%; Air Materiel Command—4 to 7% range, average on small business contracts 6.25%.

"On the basis of these fee ranges, coupled with the fact that the payment of these fee levels did not hamper efforts to obtain research and development or adversely affect expeditious performance and quality of research and development work, the conclusion was that no general increase in the DOD fee objective was indicated," McGuire said. "Accordingly," he added, "there has not been any general increase in our profit objectives in 1957, 1958 and 1959, and, although the final pricing results are not generally available, we do not believe that the final negotiated prices showed an increase. With respect to the fees allowed, our studies definitely establish the fact that there has been no general increase."

What's ahead for 1960? The defense official doesn't say. But several airframe manufacturers aren't waiting for an increase from the government. They are in the process of diversifying to broaden their profit base, which may make the DOD happy. But unfortunately diversification takes money, too—money that otherwise might go into research vital to winning the technological race against Russia.

VOUGHT DESIGNS QUARTE
FOR SPACE EXPLORERS

Chance Vought's qualifications ha
directed the company into one of t
most challenging areas of space explo
tion: the control compartments
manned space vehicles.

Responsible is Vought's reputation
"human factors" – the pilot conside
tions that must be designed into
vanced aircraft. Vought showed an ea
appreciation for human factors, e
ploying biochemists, psychologists a
human engineering specialists in dev
opments such as that of the *Crusa*
fighter.

In spacecraft, these factors are ev
more important. They affect the desi
of the entire vehicle. They bring i
focus the tremendously hostile envir
ment of space, and a completely n
regime of aeromedical problems.

In preparation, Chance Vought h
marshalled space age research and
sign aids. A "hot-shot" wind tunnel
example – capable of duplicating t
rific re-entry heats; and high-spe
computers to calculate trajectories a
orbits for solar system flight.

Vought is a member of the Boei
Airplane Company team in the Air For
competition to produce the highly a
vanced *Dyna-Soar* boost-glide vehic

At the same time, additional intensi
company research programs are und
way for putting man into space.

*Astronautics is just one in the bro
spectrum of Chance Vought fields
activity. Other areas include: design a
production of high performance aircra
electronics, advanced weapons, an
submarine warfare, range systems ma
agement, commercial process cont
systems.*

CHANCE VOUGHT
DALLAS, TEXAS

NEW THEATER OF AIR FORCE ACHIEVEMENT

The first astronauts have been chosen by the National Aeronautics and Space Administration, and Air Force pilots are among them. These men will blaze a trail into space. The first step will be soon — a boost into orbit, a capsule parachute journey back to earth. Next will come very high flights with controlled, glider-like landings. Then, one day, astronauts will pilot space cruisers throughout our solar system. Air Force, Navy and Marine pilots are taking the first step toward use of space in the NASA program, bringing the military pilot a giant stride forward in the evolution to spaceman.

DATA PROCESSING SYSTEMS SPECIALISTS

The Techniques of High Speed Data Processing Offer A Big Future For You!

A missile comes "of age"—reaches operational status—as a result of many influences. Vital among these influences is the rapid incorporation in the test vehicle of modifications required by evaluation of flight performances. The faster these modifications are made, tested, and become incorporated in the design, the faster the vehicle is declared operational.

The completion of this cycle is dependent too upon the speed with which vast amounts of test data can be reduced, analyzed, evaluated, and reported to the military and to the cognizant weapon systems contractors.

So, with the advent of missiles has come a revolution in data processing techniques—a revolution in which the Engineering Services Division of Telecomputing Corporation has been highly successful in greatly reducing the elapsed time for complete processing of missile flight test data.

This is an invitation to join the data processing specialists who comprise the Engineering Services staff—a staff which establishes the state-of-the-art in data processing techniques and methods as we go about our job of computing the performance of missiles under test at the White Sands Missile Range.

Join us and work with high speed digital computers and other modern data processing squipment in reducing the test data from scientific data measuring systems such as, cinetheodolites, electronic measuring systems, precision optics, and telemetering systems.

Join us—and grow with us—as our advanced processing techniques are employed in this fascinating field of missile flight testing so important to our national defense effort.

propulsion engineering

Binders of future solid propellants may be oxidizers instead fuels. At least that is the line of thought opened up in the chem industry by the recent announcement that the Army Rocket Guided Missile Agency's $750,000, one-year study contract on s propellants went to Allied Chemical's General Chemical Divis The division makes fluorine, chlorine trifluoride, and bromine pe fluoride—all under study, or in development, as super oxidizers. present, binders are fuels that hold together such oxidizers ammonium perchlorate or ammonium nitrate.

Talk that the roles of fuels and oxidizers in solids may rev has been heard several times in recent years. Allied's entry propellants in a big way (it has been in the business "through back door" for several years as a supplier of fluorine and o chemicals) almost certainly means that at least one solid prope will feature a fluorine-based oxidizer-binder holding an unspec fuel. The result could be a fluoro-plastic oxidizer-binder homogen with a rubber or urethane fuel-binder. Allied will conduct the v in its General Chemical research laboratory, Morristown, N.J.

Look for a major research effort to push chlorine into mis possibly as an ingredient in a synthetic structural material, mayb a propellant system. Reason for the chemical industry push: C capacity. The industry was caught in a bad squeeze when n ethylene glycol manufacturers switched from a chlorine process r over to the ethylene oxide route of producing the glycol.

Further overtures to missile business by the chemical industry seen in several of the newest chemical plants now in produc or under construction. Examples: Air Reduction's new oxygen nitrogen facility has started production at Denver; National Cyli Gas Division of Chemetron Corporation has put its new $1,750. 35 ton/day liquid oxygen, nitrogen, and argon plant on strea Los Angeles; Texas Alkyls, Inc., has begun a new $1 million minum alkyls plant at Houston.

The Texas Alkyls plant is a joint venture of Stauffer Chem and Hercules Powder, both already in the missile supply busi making mostly fuels and oxidizers. The aluminum alkyls will two major uses in the missile industry: They will be highly effe catalysts in vital chemical process operations; and they will be as, or in, self-igniting hypergolic propellants for upper rocket st Initial production will exceed 1 million lbs./year, beginning late year or early next.

Foote Mineral Company still is chafing under the Atomic En Commission's order ending purchases of lithium hydrides, but exp to make a major comeback almost immediately. Foote chem under research director Dr. E. M. Kipp, have developed a new lit hydride—or type of hydride—that is a much more reactive redu agent than present commercial lithium hydrides. Foote says not about the missile applications, but in a propellant system the oxi is complemented by the reducer as a fuel.

Lithium nowadays almost always gets into fuel conversat wherever missilemen meet. Foote is part owner of HEF, Inc., w is gearing up for a major role in propellants. However, Foote it will be several years yet before HEF contributes substantiall Foote's income. In the meantime, Kipp and his associates have c up with two more items of missile interest: A new series of hi reactive and very uniform lithium dispersions (metallic); an cheap, controllable process for turning out lithium butyl as cat for several reactions.

But if you want to try, do this:

- Spend 20 years applying advanced metallurgy to production.
- Shake down 35 high-temperature alloys in the laboratory.
- Fabricate these super-alloys into critical hot-part components for prototype power plants.
- Swing into volume production of proved designs.
- Prove, over and over again, that you know what you're doing—with jet, propjet and piston engine components and afterburners, ramjets and rocket motors.
- Make your name a byword for high-temperature research and development... for precision-made components and complete power packages.

Better still—take a 20-year stride by putting Ryan to work on your heat problems.

British Astronautics

U.K. is Develop
A-Warheads for T

by G. V. E. Thompson

LONDON—At present the only listic missile in Britain capable of ing fired is the *Thor*, supplied f America with its atomic warhead that Britain can be completely i pendent in the manufacture and of atomic weapons, British warh are being developed.

In addition to those for the A artillery and for bombs, there wil H- and A-bombs warheads for *Blue Streak* ballistic missile, the tol/Ferranti surface-to-air *Bloodho* and the English Electric surface-t *Thunderbird*.

• **Upper atmosphere densities**-G. King-Hele of the Royal Air Establishment, Farnborough, has lysed the orbits of artificial earth s lites to estimate the mean density the amosphere at heights between and 400 km. The chief difficulty in analysis is the evaluation of the qu tity SC_d, (in which S is the mean cr section of the satellite perpendic to the direction of motion, and C the drag coefficient). Its value depe on the shape of the satellite, the n ner in which it is rotating, and way in which the air molecules are flected from its surface.

It is particularly difficult to mate for cylindrical satellites (*plorers 1, 3, 4* and *Atlas*). King-H thinks that these, and the rockets the Russian satellites, have rot about their axis of maximum mon of inertia—that is, about an axis pendicular to their length. The a between this axis and the directio rotation has varied—the extreme c are motion like a propeller and tur ing end-over-end. The following va for mean density were obtained:

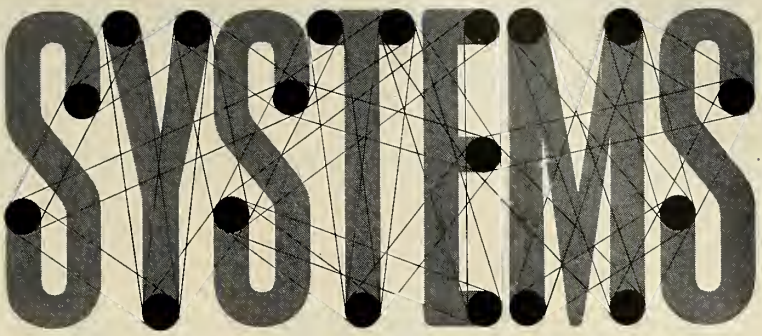
Height, km.	Air density/-sea level density	Mean de (g./cm.
200	3.4×10^{-10}	4.1 x 1
220	2.0×10^{-10}	2.5 x 1
240	1.2×10^{-10}	1.5 x 1
260	7.6×10^{-11}	9.3 x 1
280	4.6×10^{-11}	5.6 x 1
300	2.9×10^{-11}	3.6 x 1
320	2.0×10^{-11}	2.4 x 1
340	1.4×10^{-11}	1.7 x 1
360	9.7×10^{-12}	1.2 x 1
380	7.1×10^{-12}	8.7 x 1
400	5.3×10^{-12}	6.5 x 1

The actual density naturally varies f day to day. The factor of error for

figures is not greater than 1.5.

Missile secrets plane lost—A ered Avro Tudor plane carrying missiles (believed to be the *Fire-*) and secret documents to the nera rocket range was recently re- d missing in Eastern Turkey. It t first feared that the plane might been captured by the Russians, flight path lay close to the Soviet r, but its wreckage was later ed on a snow-capped plateau 1000 low the crater of the extinct vol- 14,434 ft. Mount Subhan. The F. mountain rescue team sent to te were impeded by snow, difficult ing conditions, bears and wolves; eaching the wreckage they found all twelve occupants were dead. t material was removed and the ish army has been asked to ex- the missiles.

n enquiry into the accident will ld, and in future such flights will bly be routed via Africa to avoid ng too near Russian territory.



Underwater escape tests—Since five-sevenths of the earth's sur- is covered with water, the possi- of a manned satellite vehicle des- ng in the ocean is quite high. A of experiments made by the U.K. iralty Hydro-Ballistic Research lishment is of interest in this con- on.

tandard aircraft ejection seat ment was fired under water and urements were made continuously e acceleration of the seat and of mmy it contained; the pressures e gun, at various points close to e the gun separates, and at the and abdomen of the dummy.

he maximum velocity of the seat determined by using it to move a permanent magnet over equally- d coils fitted to the fixed frame- . The dummy was ejected satis- rily under water, but the pressures ed may be too high for a pilot. gun pressure dropped from 2000 o 1000 psi. at discharge; an en- d bubble then formed and water ance maintained the pressure for ger period than in air. Near the ny, the pressure varied from 0 to si.

To meet numerous requests m readers, M/R has made ilable reprints of the recent ies of articles by Dr. S. Fred ger on the meaning of Project gus. Copies of the combined ies may be obtained by writing the magazine. The rate is 50¢ a single order (bulk rates on uest).

Explore new areas at IBM in

Electronic systems engineering covers the full spectrum of applied research and development at IBM. Currently, engineers and scientists concerned with broad systems problems in business, science, and government are working toward self-optimizing computers that may some day program themselves and arrive at the one best solution to a problem. Progress is being made in advanced studies for radically different data systems for terrestrial and stellar navigational problems. For problems like these, and many others, IBM needs people who want to convert challenges into careers.

You will enjoy unusual professional freedom, comprehensive education programs, the assistance of specialists of diverse disciplines, and a wealth of systems know-how. Working independently or as a member of a small team, your individual contributions are quickly recognized and rewarded.

Spacecraft Materials Probed by Symposium

by Frank G. McGuire

PALO ALTO, CALIF.—Technical pects of temperature, erosion, spu ing, lubrication and vacuum effects materials were thoroughly discusse the first Symposium on Surface Eff on Spacecraft Materials, co-sponsc by Lockheed and ARDC. Over hundred scientists from throughout country attended the meeting, the of its kind to deal with thermal de and surface effects exclusively.

• **Vacuum effects**—Dr. M. R. A ter of the Naval Research Laborat reported on research involving changed characteristics of mate under high vacuum conditions. creep strength of some metals goes when in a vacuum, Dr. Achter s but with high temperatures they r actually be weaker in space than earth. This reversal will have to be c sidered in designs of future spacecr

Changing many of the parame of testing could completely reverse results of a test, according to Ach The loading of the sample, as wel great changes in temperature, cc substantially alter the end result i creep-strength or fatigue test.

Other researchers, discussing sublimation of materials under l vacuum, stressed the need for l vapor-point materials in the consti tion of spacecraft, because vacuum fects them less than other mater As one extreme example, it is poss for a spacecraft to vanish due to "ev oration" of the metal, and resul changes in the bulk properties.

Experiments on plastics and cer metals have been conducted to st this effect at various temperatures. far, these experiments have shown portant changes in materials follow prolonged exposure to vacuum. M subtle effects due to absence of surf gas layers include changes in the efficient of friction, fatigue and cre rupture characteristics.

• **Lubrication**—It probably will necessary to use solid-film lubricant space, but graphite has virtually b ruled out due to the necessity of hav water vapor in the environment s rounding the lubricant. Dr. Bruce D iel, Midwest Research Institute, the symposium that the best solid-l lubricants found so far are molybden disulfide and tungsten disulfide, but they are not as efficient as desi under high-temperature conditions.

Work is under way at Midwest search Institute to determine the act mechanics of friction by use of gra ite whiskers. These hard-to-prod

ANOTHER **MARMAN** FIRST!

Quick, Off-the-Shelf Delivery of Quality Clamps, Couplings, Joints

FROM OUR NEW WAREHOUSE

than 450 different parts are now avail- from stock in the new Marman warehouse.

With the completion of a new warehouse, Marman has initiated a unique inventory program for off-the-shelf delivery of many types of Marman Products.

Now, oircraft/missile engineers and buyers can select high quality Marman Clamps, Couplings and Joints from standardized styles . . . for immediate delivery!

BETTER SERVICE

This new inventory program is designed to provide better service to all of our customers. By ordering standardized products for fastening and joining, wherever possible, manufacturers can eliminate the extensive lead time normally needed for tooling and production.

WIDE SELECTION OF STYLES AND SIZES

At present, 10 basic Marman Products (shown above) fit into this inventory program. These clamps, couplings and joints are now available in a wide range of stock sizes, styles and materials that include 458 separate part numbers. As other products adapt to standardization, they will be added to this list.

IMPORTANT COST SAVINGS

Another very important customer advantage is the reduction of unit costs of inventoried items. This is possible because special production dies, inspection gauges, etc. are not required; optimum production runs can be scheduled; better volume purchases of manufacturing materials can be made. All of these savings are reflected in the new off-the-shelf prices.

Full information on this inventory program including parts specifications, sizes, materials, and prices is now available.

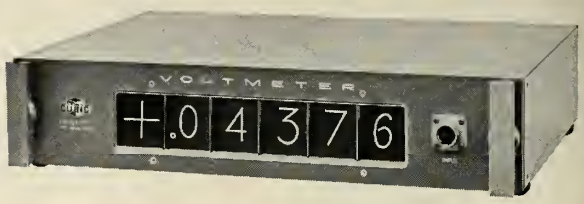
CUBIC

The Difference is in the Quality

Four and Five-Digit Transistorized

DC VOLTAGE INSTRUMENTATION

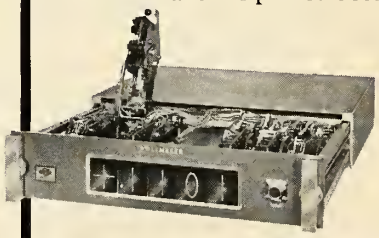
For Rapid, Precise Voltage Measurement



Designed for Versatility
Engineered for Reliability
Precision Built, yet Rugged
Easy to Use, Easy to Maintain

NOT JUST A 'VOLTMETER' . . .

. . . this superior Cubic instrument can measure with great accuracy every phenomenon of science which can be converted to a usable DC voltage level . . . pressure, temperature, depth, volume, salinity, etc. Great economy can be effected through use of the Digital Voltmeter in applications which require precise, legible readings to the unskilled worker without danger of costly operator error. Outstanding engineering and design talents have been combined to produce this fine DC Voltmeter, the most reliable Digital instrumentation available today.



SPECIFICATIONS

Available with 4 digit (Model V-41) or 5 digit (Model V-51) display, the Digital Voltmeter is powered by Control Unit Model C-1, which includes a power supply, precision reference and differential amplifier, and which, separately housed, supplies power to as many units as are required in a Digital System. The Cubic Voltmeter provides an accuracy of .01% plus or minus 1 digit, between ±.0001V and ±999.9V (Model V-41) and ±0.0001V and ±999.99V (Model V-51). Low level voltages ±10 microvolts may be measured by the addition of the Preamplifier unit, Model PA-1.

THE SUPERIOR DIGITAL INSTRUMENT

Space Age know-how that goes into Cubic Corporation's missile tracking systems is also an important engineering and production component of Cubic DC Voltage instrumentation. The 4-digit and 5-digit Voltmeters, powered by the Cubic Control Unit, offer such quality features as unit plug-in construction, a precise two-part filter that eliminates the effect of AC ripple on DC readings, shock-mounted stepping switches with "controlled drive," in which the switch turns off the drive circuit part way through its cycle, ending overdrive and eliminating impact wear. Clear visual display is provided by an ultra-brilliant, edge-lighted read-out containing in-line numerals one inch high. Transistorization ends warm-up time, lengthens instrument life. Cubic's attention to fine detail increases the precision, reliability and functional capability of each instrument and at the same time provides such outstanding features of standardization as printed circuit boards that are interchangeable and stepping switches that swing up and out for ease of routine maintenance. Cubic quality is your guarantee of truly fine instrumentation.

Unit construction of the Cubic Voltmeter and other Digital instruments provides maximum flexibility in creating "systems that design themselves." Inter-*case* wiring and standard-size plug-in units make every Cubic System a customized system using standard units. "Building Block" units which can be added easily to increase systems capabilities are the DC Preamplifier, AC-DC Converter, Digital Ohmmeter, Ratiometer, Master and Auxiliary Scanners and Printer Control Units. Write today for further information.

strands of graphite are used as specimens for tensile-strength tests, and for examination into the crystalline structure.

The crystalline structure of graphite is similar to that of molybdenum disulfide and tungsten disulfide, but where graphite needs water vapor in its environment in order to act as an efficient lubricant, the other two use sulphur.

• **Erosion**—The action of particles of varying sizes in space on the surface of a spacecraft was looked at from a number of angles: micrometeorites, dust, and individual atoms and molecules. (Results of a collision with a full-scale meteor were so obvious as to eliminate need for discussion.)

Erosion by interplanetary dust, reported Dr. David B. Beard of the University of California, probably will amount to negligible damage to a satellite. The actual amount is calculated to be 10^{-5} to 10^{-6} particles larger than 4 microns impacting cm^2/sec. (i.e. 30 to 300 impacts/cm^2/year).

Calculating the origins of comets within the solar system has indicated they are "balls of fluff" generally found in the cold regions of space until a passing body sets them in motion. When these comets pass near the sun, dust is thrown off and gradually populates the solar system. The dust, which also comes from other sources, is the cause of the "Zodiacal light" observed at night, since it reflects the light of the sun to the dark side of earth in minute quantities, leaving a milky haze over the sky.

To remain in the solar system, these particles must be at least 3 microns in size—a smaller particle would be forced out of the system by radiation pressure. Density of this dust is greater near the earth due to gravity, where it reaches about 10^{-12} particles per cubic centimeter, as compared with an average density of 10^{-14} or 10^{-15} per cubic centimeter throughout the solar system in general. A particle of 4 microns or larger, therefore, is needed to register appreciable damage on a surface.

A particle having a mass of 10^{-13} grams (low mass but high velocity) would immediately vaporize upon striking a satellite surface. However a greatly prolonged exposure might show appreciable damage, and in some cases could surpass that inflected by larger, but less frequent, particles.

To gain more knowledge of this dust, consideration is being given to exposing a sheet of sticky mylar film on a rocket or recoverable satellite to capture some and bring it back for analysis.

NEW GENISCO MINIATURE ACCELEROMETER

Weighs only 3 ounces; measures just 1 1/16" x 1" x 1 1/8"!

The new Model GMA Accelerometer is a fluid damped, potentiometer output instrument, particularly suited for flight and fire control and telemetering applications. Now in production.

Brief Specifications

Range: ±0.5 g to ±100 g's
Natural Frequency: 12 cps to 75 cps
Linearity: ±1% of full scale
Damping: Nominally 0.7 of critical at ±75°F.
Temperature: Operates to specifications between −20°F and +185°F.
Vibration: 10 g's, 10-20,000 cps, any axis
Shock: 50 g's for 7 ms, any axis

MODEL GMA

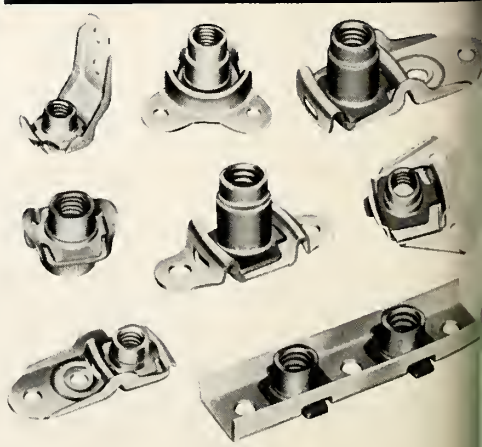
Nutt-Shel's TIMESAVERS

in 5 SECONDS you can replace the nut in a **TIMESAVER**

1. Insert removal tool, with downward pressure, between nut and shell, as shown. Lean tool against nut barrel to insure engagement.

2. Maintain downward pressure. Nut will snap out easily with a simple prying motion.



3. Install new nut by inserting one lug in shell and striking opposite lug with screwdriver. This lug snaps into place.

the greatest advancement to date in efficient fasteners

Four hundred and seventy-two engineers voluntarily wrote to us and said, in essence, *"a definite improvement that saves time and reduces costs."*

HOW MUCH SAVING? TIMESAVERS are competitively priced, but they cost you less, since savings in replacement time are greater than cost of ordinary nuts, *including installation.* They are as light as other nuts; in certain designs they *weigh less.* They meet MIL-N-25027 (ASG) and conform to NAS specifications.

May we show you why engineers and production men prefer TIMESAVERS? Write on your letterhead for new lightweight nut brochure which describes these and other Nutt-Shel fasteners.

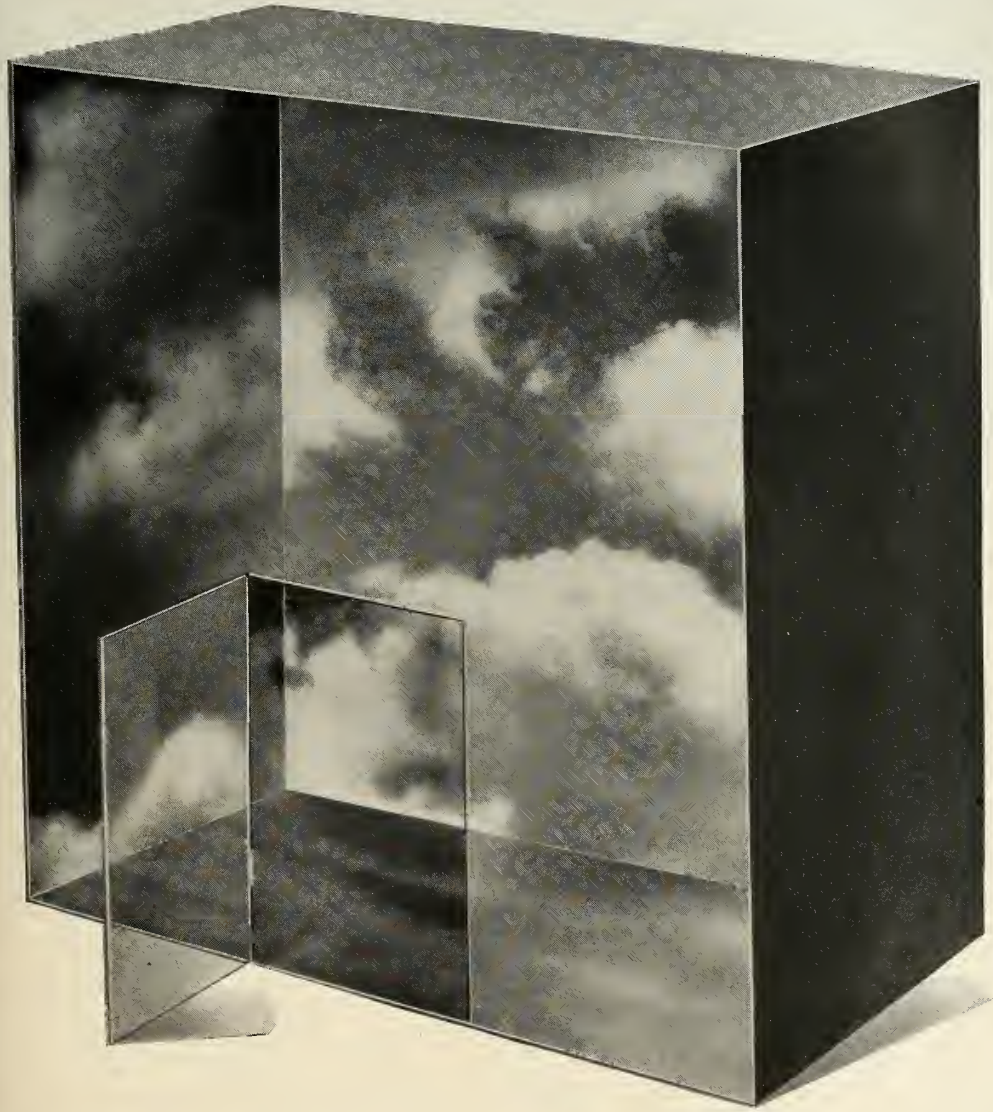
ADVANCED FUEL MANAGEMENT ...FROM SMI

The requirements of accurately tanking missiles with propellants is but one of the areas of fuel management in which Servomechanisms, Inc. has demonstrated capability. *Propellant utilization* and *thrust control* are other areas in which SMI has developed highly accurate and precise measuring and control systems.

SMI's LOX Tanking Computer, which has been in production for the past year, accurately measures, controls and indicates the level of liquid oxygen in missile tanks. Loading is accomplished rapidly and accurately due to a unique two-mode control system. The first mode permits extremely high pumping rates until about 98% capacity is reached. The second mode then takes over and controls a precise proportioning valve which adds the necessary LOX to fill the tank within 0.1% accuracy. The second mode also provides continuous topping, thus compensating for LOX evaporation losses during standby.

SMI has currently in development, more advanced fuel management systems to meet the increasingly complex requirements of the next generation of missiles and spacecraft.

SMI would welcome the opportunity to discuss and propose solutions to your fuel management problems. Write for descriptive literature.



Positions are available for qualified engineers and scientists in the areas of:
Systems Synthesis and Analysis—Project Management —Qualification and Environmental Test Engineering—High Vacuum Deposition Techniques.

LOCKHEED'S
New Multi-Million Dollar
RESEARCH CENTER

This project—destined to rank with the world's largest and most advanced Research Centers—represents not only substantial faith but a substantial investment in the future of space flight.

The new Center, now under construction near Los Angeles, will provide facilities for: Exploration of complex technological space requirements; scientific latitude and freedom; ideal environment for research; and the most modern laboratory tools available. Qualified scientists and engineers will find here ground-floor opportunities for extending man's knowledge beyond the present state of the art.

On completion, most of Lockheed's California Division's research facilities will be located in this single area. The Center will provide advanced research facilities in all fields related to atmospheric and space flight including: Propulsion, physiology, aerodynamics and space dynamics; advanced electronics in microwave propagation and infrared; acoustics; mechanical and chemical engineering and plasma/magnetohydrodynamics; thermal electricity; optics; data communications; test and servomechanisms.

Top-level scientists and engineers are invited to investigate outstanding career opportunities for your future in the new Lockheed Research Center. There are openings now for qualified personnel in: Electronics; aero and thermo dynamics; propulsion; servomechanisms; materials and processes; structures and stress; operations research; research in optics, infrared, acoustics, magnetohydrodynamics, instrumentation, mechanics and hydraulics; mathematics; and in all phases of design.

Please direct your inquiry to: Mr. E. W. Des Lauriers, Manager Professional Placement Staff, Dept. 1706, 2400 N. Hollywood Way, Burbank, Calif.

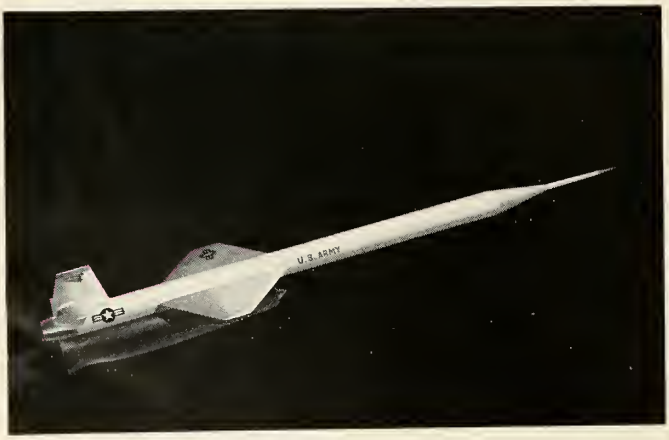
COVER: Scott Crossfield checks out *X-15* prior to first drop with engine ignition.

GE'S MK 44 acoustic homing torpedo is latest entry in Navy's arsenal. It can be surface-launched or air-dropped in the vicinity of its submerged target.

ANOTHER GE development is this Gun and Guided Missile Director MK 73 which controls the Navy's *Tartar* Surface-to-air missile. Director has gearless power drive.

GE also has developed silicone sealant for Lockheed's *Kingfisher* which improves recovery chances and cuts manufacturing costs $1600 per missile.



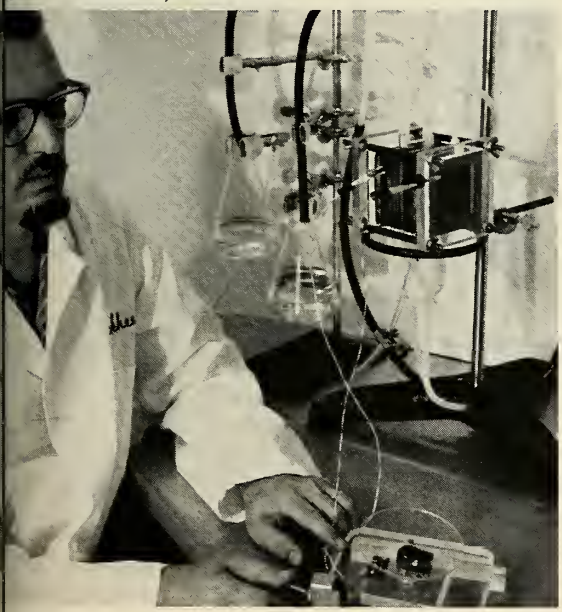
What Lockheed is doing today to develop
Tomorrow's missiles and spacecraft

The world's first polar-orbiting satellites...the world's fastest ramjet target drone...a "fuel cell" that produces auxiliary power for spacecraft in a radically different way...a TV camera-transmitter—the world's smallest—that gives engineers and scientists on the ground a televised report of what takes place in test missiles during flight. These are just a few of the many activities and achievements of Lockheed's Missiles and Space Division.

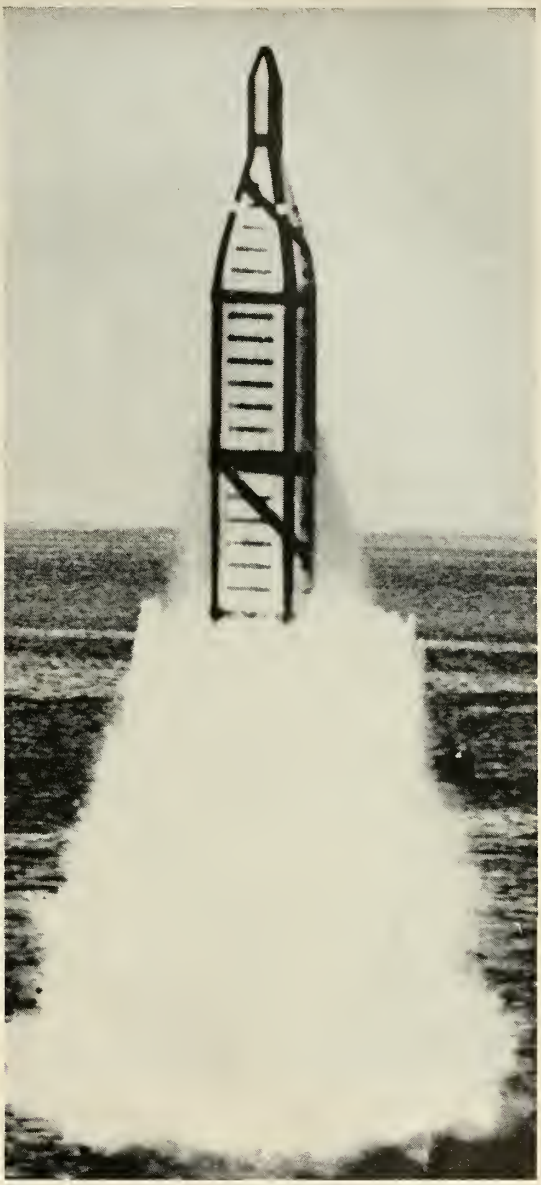
Lockheed is System Manager and Prime Contractor of the ARPA DISCOVERER satellite series—and the U. S. Navy's POLARIS missile. Both are highest priority programs of the U. S. Government. And both are ahead of schedule.

A Lockheed MSD work-force of over 16,000—including 3,500 scientists and engineers—is engaged in all phases of missile and space technology: satellite systems development; space communications; electronics; ionic, nuclear, and solar propulsion; magnetohydrodynamics; computer research and development; flight sciences; materials and processes; human engineering; electromagnetic wave propagation and radiation—and many other advanced fields.

From these efforts at Lockheed will come many significant breakthroughs and scientific "firsts"—to speed the development of tomorrow's missiles and spacecraft.



Ramjet-powered supersonic target, Lockheed Q-5 KINGFISHER electronically simulates enemy attackers—is being used by U. S. Army to evaluate and sharpen our nation's missile marksmanship, increase our defense capabilities.



First polar-orbiting satellites, the Lockheed DISCOVERER I and II were orbited in two succ launches. Lockheed is System Manager for this advanced scientific research program.

ısmitting performance data from missiles and test vehicles, ct to ground stations, Lockheed-developed TV camera-mitter and PAM-FM telemetry systems are acknowledged to e world's smallest, world's best.

olutionary "fuel cell," under development at Lockheed, con- chemical energy directly into electrical power—for auxiliary er requirements of miniaturized spacecraft instrumentation space communications systems.

Erupting from beneath the sea, a full-scale POLARIS test vehicle demonstrates how operational missile will be launched from submerged U.S. Navy subs. Ultimate range of the POLARIS will be 1500 nautical miles.

GENERAL TI

AZUSA AND NEAR SACRAMENTO, CALIFORNIA • A SUBSIDIARY OF THE GENERAL TIRE & RUBBER CO

Proposed—A Unified Strategic Command

The Joint Chiefs of Staff are considering the creation by mid-1960 of a single unified command for the strategic warfare forces of this country—a command to include those components from the Air Force and the Navy which have strategic weapon systems. It would probably be called simply the U.S. Strategic Command.

The commander would report directly to the Joint Chiefs and not to his own service and he would have operational control of the combat units assigned to him, regardless of service, both in the cold war and in a hot war should it develop.

The commander would most likely be Air Force due to its preponderance of strength in the field, with the deputy a Navy man and the staff combined USAF and USN.

The formal papers proposing such a move were presented to the Joint Chiefs several days ago and have circulated widely through the higher echelons of all services of the Pentagon. The proposal recommends implementation of such a command arrangement to become effective by the time the first *Polaris*-equipped vessel is ready for operation employment (mid-1960). It also recommends that concurrently with the activation of such a command the present SAC go out of existence as a specified command, i.e., one which reports directly to the JCS as SAC now does, and remain simply as an Air Force component command.

The proposal was put forward by General Thomas White, chief of staff of the Air Force (and a member of the JCS, of course) and is known to be favored by many high officers of both the Air and Sea services.

Several cogent reasons have been advanced as to why the big bombers and long-range missiles of the Strategic Air Command and the intermediate range missiles of the Navy should be unified under one commander:

- Formation in peacetime of a strategic force which would operate effectively in the event of a war.
- Prevention of overlapping and duplicating roles.
- A firm and effective assignment of strategic targets.
- Assurance of instant response to higher command, instant reaction and instant application of full strength.

In his proposal to the Joint Chiefs, General White recommended that the Joint Staff, in conjunction with the Air Force and the Navy, join to define the mission, responsibilities and organizational establishment of the new U.S. Strategic Command. In the services, such a task would probably fall to General Thomas Power, SAC commander, and possibly to Rear Admiral L. R. Despit, Director of the Undersea Warfare Division, Office Chief of Naval Operations, since the Navy has no strategic division as such.

This combine probably would also develop organization arrangements, manning and the phasing of implementing action by timetable.

* * *

This proposal by the Air Force Chief of Staff to take a very intractable bull by the horns and wrestle it into submission is quite in keeping, both for the man and for the present trend to reorganize the services by missions rather than by color of uniform.

For one thing, General White has more than once made it known that he favors unification of the services. For another, his proposal is fully in accord with both the intent and the spirit of the Reorganization Act of 1958, other parts of which have already been implemented.

The North American Air Defense Command at Colorado Springs not only unifies the U.S. Services but includes the Canadians as well. The Alaskan Command has long been unified, as have the service units in Europe and the Far East. Before the Reorganization Act these unified commanders could give orders to other service units only through their parent organizations—usually in Washington. Now the commander has direct control and reports to the JCS, as would the new Strategic Commander proposed by General White.

When the soldiers, sailors, airmen and marines all climb into one uniform and become identified by their mission instead of their service, is a matter of conjecture, although it certainly seems inevitable. But to group the strategic forces of the country—with their overwhelmingly important task of deterrence through the threat of massive retaliation—under one unified command seems to make a great deal of sense in an imperative situation.

One of the weakest links in the American strategic position has been that the Navy and the Air Force have never been able to coordinate strategic targets. With a considerable capability in the strategic field, the Navy would never make a firm individual target commitment because of a wish to remain completely mobile. And SAC would never accept anything less than a firm specific commitment. In the event of war, the delay of decision in just this one area could be disastrous.

And . . . if this proposal is the first step toward a unified Tactical Command, a unified Training Command, a unified Materiel Command and so on—so much the better.

Clarke Newlon

...NEWS IS HAPPENING AT NORTHROP

Now being produced and delivered to the U.S. Army Signal Corps, the Radioplane SD-1 gives greater battlefield surveillance flexibility to combat units than ever before. (This photo of terrain was actually taken from an SD-1 at 1,000 feet.)

RADIOPLANE PRODUCES FIRST COMBAT-READY SURVEILLANCE DRONE

Meeting tough Army Signal Corps requirements and being produced in operational quantities, the SD-1 is proved and ready to fly unmanned photo reconnaissance missions for tactical troops.

Highly mobile, the camera-carrying SD-1 may be zero-length launched in rough terrain from a camouflaged position. It is flown by remote control over enemy installations on surveillance missions without risking a pilot's life or man-carrying aircraft. Within minutes after the SD-1 returns from its mission, photographs are delivered to the requesting unit.

Other specialized sensory equipment may be carried by the SD-1 depending on particular mission requirements.

This Army-Radioplane achievement exemplifies Radioplane teamwork with all of the U.S. Armed Forces. Radioplane provides a complete drone family spanning medium speeds through supersonic performances.

IN THE PENTAGON

ARPA is pushing ahead seriously with its program aimed at developing a space platform weighing several thousand tons. The platform would be launched into space with nuclear-bomb propelled rockets. ARPA describes the team working on the program as made up of "some of the best men in the country."

• • •

The Pentagon is reportedly near a decision whether to develop a storable propellant for the Convair *Atlas*. A storable propellant for the nation's first liquid ICBM would give it two extra pluses: Faster reaction time and mobility.

• • •

A possible new interservice squabble may be in the making over who will operate the "satellite fence" developed across southern United States. ARPA directed development. Both the Army and the Air Force played a part. Now ARPA is ready to turn it over to one of the services.

• • •

The Air Force is planning to spend about $23 million in FY 1960 on development of a new secret missile—the anti-radar missile. The ARM apparently would be air-launched from attacking bombers. It most likely would foul enemy radar by dropping chaff and/or by carrying electronic jamming equipment.

• • •

The Army's *Davy Crockett* missile has blossomed into a family of weapons. The secret missile—tipped with a nuclear warhead—is understood to be small enough to be fired by an infantryman from a bazooka-type weapon.

• • •

A couple of notes on the Missile Gap calendar:

The Martin *Titan* timescale is about two years behind the Convair *Atlas*—not one as believed in many quarters, according to Congressional testimony by the late Donald Quarles.

Some six months could be shaved from the Boeing *Minuteman* program. Cost would be about $100 to $300 million depending on who in the Pentagon is doing the estimating.

• • •

The Navy wants to cut back R&D funds for two new anti-submarine missiles and boost R&D funds for two others. The cuts are slated for Minneapolis-Honeywell's *Asroc* and Westinghouse's *Astor*—understood to be an anti-submarine torpedo rocket. Boosts are slated for Goodyear's *Subroc* and *Little Lulu* —believed to be a surface-to-surface missile.

ON CAPITOL HILL

A leading Congressional figure close to the nation's space program says the Russians have made a number of space shots since *Lunik* in January. He says he received the information from "good authority." He says the Russians apparently are withholding any announcements until they have something sensational to disclose.

• • •

Some Congressmen are predicting that the Senate and House may settle their dispute over the Boeing *Bomarc* and the Western Electric *Nike-Hercules* with a compromise involving *Atlas*. The possible deal: The Senate would go along with a House desire for more funds for *Atlas*. At the same time, the House would put back some of the funds asked for *Nike-Hercules*.

• • •

Despite opposition from the Administration and some influential Congressmen, Congress appears certain to keep a double hold on NASA. The House already has voted to make NASA secure Congressional authorization for all programs before securing any appropriations in the next five years. Many powerful senators want to make the arrangement permanent. Outlook: The least NASA can expect is the House's five-year clause.

AT NASA

The schedule for Project *Mercury* includes more than two dozen launchings before any attempt will be made to put a man into orbit. One of the last before the big one will be the firing of a manned space capsule down the Atlantic Missile Range with a *Redstone* booster.

AROUND TOWN

Plans are moving ahead rapidly to make Raytheon *Hawks* the first American-type missile to be produced cooperatively by NATO countries. The second probably will be Philco *Sidewinders*. The U.S. military aid program is helping get the programs under way. The NATO countries involved are reported ready to pay $400 million for the NATO-made *Hawks*.

AIR FREIGHT EXCLUSIVE

Personalized service by United Air Lines means satisfied shippers, more efficient shipping

Air freight service by United Air Lines is personalized just for you. Guaranteed space is yours for the asking, and your shipments always receive the personal attention of United Cargo Representatives. Handling procedures, too, are custom-tailored to each kind of cargo. And freight is monitored every minute and mile of the way.

AND MORE "EXTRAS"

Reserved Air Freight guarantees space at the regular rate on any United flight going anywhere.

2000-community service lets you reach more major markets direct than on any other single airline.

Mainliner® and Cargoliner flights both carry freight, and assure you of frequent high-capacity service.

Door-to-door service is another convenient United feature for minimum handling and top speed.

FREE BOOKLET

Tells how United Air Lines Air Freight provides better service and lower costs for shippers. Just write to Cargo Sales Division, United Air Lines, 36 South Wabash Avenue, Chicago 3, Ill.

STRUCTURES

Thoric—intercontinental version of Douglas *Thor* IRBM—is being evaluated by Air Force as means of accelerating nation's ICBM readiness. Question is whether *Thoric* should be advanced on "crash" basis to back up *Atlas*. Configuration would be adaptation of liquid two-stage *Thor-Able* test vehicle which has hurled experimental nose cones 5000 miles down Atlantic Missile Range.

• • •

Cincinnati Testing Labs will receive contract to produce nose cones for Martin-Orlando's *Pershing*—800-mile MRBM solid-fueled successor to *Redstone*.

• • •

Steel gantry 305 feet high—tall as a 28-story building and the largest in U.S.—will be constructed at Redstone soon to erect and service *Saturn* space vehicle. Hugh mobile tower is indicative of the size of ABMA-ARPA's giant rocket, which will have a cluster of eight H-1 Rocketdyne engines as its booster and three other stages. Fire and lightning protection, heating and air conditioning will be incorporated in the structure along with three elevators, bridge crane, "on-board" diesel electric generator and six service platforms. AOMC and Army Corps of Engineers developed the gantry design in conjunction with Maurice H. Connell & Associates, Miami A&E.

• • •

In midst of heated DOD and Congressional sniping at the interceptor missile program, Air Force last week launched first Boeing "super" *Bomarc-B*. Despite charges it will be ineffective against ICBM's, many Capitol observers say 400-mile *Bomarc-B* probably will be phased in when ready as "best available"—with cut in *Nike-Hercules* program.

• • •

A $20 million tag is attached to the Air Launched Ballistic Missile program in the 1960 defense budget. This will pay for six-month design-cost study getting under way by Douglas and early prototype development.

• • •

Russian "mole" missile? Rocket tunnel digger which spouts compressed air and liquid fuel-fed flame to eat through rock and earth is being used by Soviets, according to Hungarian magazine *Magyar Nemzet*. (Translation available in Scientific Information Report issued by U.S. Commerce Department Office of Technical Services.)

PROPULSION

Watch for first static firing of Pratt & Whitney liquid hydrogen rocket motor about mid-fall. Test will be conducted near Lake Okeechobee.

• • •

Little progress is reported in merger talks being conducted by Thiokol Chemical and Marquardt Corp. Thiokol expects sales to hit $150 million in 1959—against $89 million last year—with a slight upward movement in earnings.

ELECTRONICS

Small Business Administration is licensing Electronics Capital Corp., San Diego., as closed-end non-diversified management investment company. It will be the first to concentrate in one field—small business electronics. ECC plans through 1.8 million stock issue to acquire $16 million for investment in small business securities. No government funds are involved.

• • •

Air Force contract for prototype development of transistorized SAGE computer is being awarded to IBM. For underground installation, computer will be 1/9 size present models and reportedly will have computation capability increased sevenfold.

ASTROPHYSICS

Capture of micrometeorites 150 miles in space and bringing them back to earth will be attempted in September by ARDC and Cambridge Research Center. Scientists will use Aerojet-General *Aerobee* rocket with snap-open nose cone. Micrometeorites will imbed in strip of sticky film. Recovery will be with a parachute. If successful project would yield first real data on composition of debris encountered by missiles and space vehicles.

SPACE MEDICINE

Full-pressure space suit being unveiled June 2 by Navy and B. F. Goodrich is designed to allow man to walk on moon. Wearers can withstand 19 g's in first 40 inches of ejection test and dunking in brine solution at −60°F. Navy says pilot wearing suit would survive as long as one hour after ditching in Arctic waters.

More about the Missile Week on page 29.

PIONEERING IN SOLID PROPULSION SYSTEMS

From the first American jet-assisted airplane takeoff to the first of our second generation guided ballistic missile systems, the Jet Propulsion Laboratory continues to be an active pioneer

In August 1941, America's first jet-assisted airplane takeoff was accomplished with an Ercoupe monoplane, using JPL developed solid propellant rockets. Scientists at JPL shortly discovered that a powdered perchlorate oxidizer, mixed with a liquefied plastic fuel binder, could be cast directly in plastic-lined light-weight motor cases. Thus a safe and cheap method was now available for preparing large internal-burning composite propellant charges. This basic process became the foundation for the modern solid propellant industry.

In 1954, U. S. Army Ordnance requested JPL to develop a compact, rugged long-range guided missile weapon system that could be transported, aimed and fired as simply as a cannon. Within five years, JPL perfected the Sergeant, the first of America's second-generation guided ballistic missiles. In January 1958, clusters of small- Sergeants helped launch America's earth satellite, the JPL built Exp which provided vital space environ information.

Now under the direction of the tional Aeronautics and Space Adm tration, the experienced JPL rese and development team continue apply solid propellant vehicles for s exploration.

MAGAZINE OF WORLD ASTRONAUTICS

Red Threat From Antarctica

U.S. and other nations are worried about Russian bases build-up and submarine missile launching potential

by James Baar

VASHINGTON—At the frozen bot- of the earth Russia is moving a position from which its missile drons could outflank the Free ld.

Half of Antarctica—that empty, d continent twice the size of the ed States—is rapidly turning from e to red.

Meantime, the United States at for the present is accepting sec- place to Russia in the comparative e of its Antarctic operations.

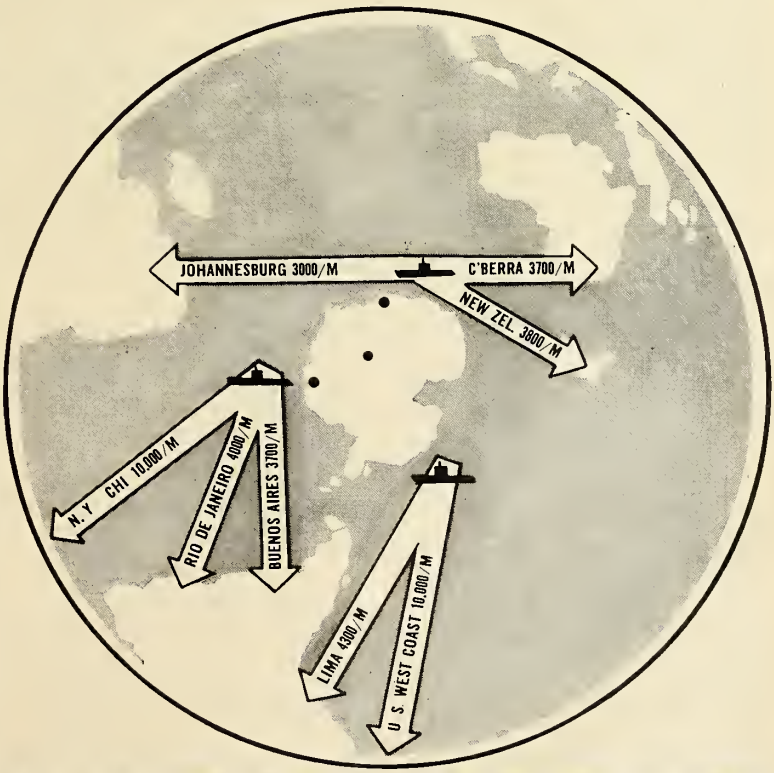
Proposals to equip American bases portable nuclear reactors and to d a year-round jet landing field at Murdo Sound are presently stalled lack of funds.

Another proposal to build a satel- tracking station at the South Pole has been at least temporarily ved.

Many knowledgeable officials in the ed States, Australia, South Amer- New Zealand and Africa are look- toward the South with increasing n.

• **Southern exposure**—From the vy Antarctic coasts and plateaus sia is in a position to have the re Southern Hemisphere within missile range. Moreover, big Rus- ICBM's could strike the United es from Antarctica without notice. The multi-billion dollar BMEWS em—designed to give SAC a life- eath 15 minute warning of ICBM's aking across the North Pole— ld be silent.

Naval patrols watching for missile- ching submarines on the U.S. East West Coasts would find nothing. lear death would come from the uarded and undefended South.



The earliest Antarctic threat involves the use of missile-launching conventional submarines operating out of the Soviet Union's increasing number of Antarctic bases.

Missile-armed submarine packs drawn from the Soviet Union's huge fleet of some 450 submarines could be sent into the South Polar seas at any time. There they could hide along the thousands of miles of empty Antarctic coast, waiting for the signal to strike.

Johannesburg . . . Canberra . . . Lima . . . Buenos Aires . . . Rio de Janeiro . . . Melbourne . . . Wellington . . . all are within a maximum of some 4000 miles of the White Continent.

• **Bases by hundreds?**—But using submarines is only the first and easiest step. The Soviets can put their ICBM's on Antarctica itself.

Missile sites—soft, or hardened—

SOVIET SUBS working from Antarctic could strike many targets without detection.

No U.S. Plans for Missile Site . . .

can be built inside the Antarctic glacier, in the opinion of U.S. experts. The Russians could build hundreds of them both near the Soviet-occupied coasts of East Antarctica and on the great plateaus in the interior.

New York . . . Washington . . . Chicago . . . Denver . . . Seattle . . . Los Angeles . . . all of the United States lying within a huge 10,000-mile arc would be reachable.

The effect on the cold war would be tremendous.

Not only would U.S. warning systems and defenses be outflanked, but three powerful new factors would be introduced into the East-West conflict:

• The U.S. heartland for the first time since the American Revolution would be menaced simultaneously on two broad fronts. Russia would have found a counter to U.S. overseas bases.

• Much U.S. ICBM power would have to be turned toward the unpopulated Antarctic wastes, thereby lessening the value of the ICBM squadrons as a deterrent of terror.

• South America and Africa would become much more sensitive to Soviet pressure as the shadow of Soviet missile might spread across both continents.

U.S. experts see nothing insurmountable in the way of establishing Soviet ICBM bases in Antarctica. As for firing missiles under Antarctic conditions, they note the United States already has fired missiles under generally similar conditions at Fort Churchill, Canada.

As for building Antarctic missile sites, they note that the United States already is building research living quarters in the Arctic glacier near Thule, Greenland.

The research building near Thule is being constructed mostly out of insulating materials put together inside a hole dug out of the glacier with a specially-designed Peters snow plow. Walls of the hole support the building.

One expert said under-glacier installations could be hardened merely by putting them deeper into the glacier.

He said that so far the United States has no plans for building such a missile site itself. However, he said it had been given a considerable amount of thought by engineers.

Officials closest to U.S. Antarctic expeditions say they have seen no evidence so far that the Russians are about to build South Polar missile sites.

• **Red carpets**—However, they say there is no question that the Russians are in Antarctica to stay and that they are expanding their operations. And these operations—still scientific—are laying a basis that could rapidly take on a military character whenever Moscow so decreed.

At present, the Russians occupy Antarctic sites at Mirny and Lazarev on the East Antarctic Coast and Komsomol'skaya and Vostok in the interior. The Poles have been given the Soviet interior base called Oazis. The Mirny base has carpets on the floor and wallpaper on the walls.

The Soviets are planning overland exploratory trips from Mirny to Lazarev via the Pole of Inaccessability and possibly one far west into Marie Byrd Land and the Bellinghausen Coast where much U.S. exploration has been concentrated.

Also, the Soviet Slava whaling flotilla recently circumnavigated Antarctica for the first time and was last reported headed toward the Bellinghausen Sea off Marie Byrd Land.

So far, Soviet rocket activity in Antarctica has been confined to the firing of some two dozen sounding rockets from the Soviet vessel 'Ob off the Antarctic coasts. Soviet scientists previously have said Russia was considering launching satellites from Antarctica.

• **U.S. de-emphasis**—As Soviet operations in Antarctica have increased, U.S. operations have decreased somewhat since the end of the International Geophysical Year in 1958.

The United States during IGY operated seven bases: McMurdo, Byrd, Ellsworth, Hallett, Wilkes, Little America and Scott-Amundsen at the South Pole.

At present, the United States is continuing to operate McMurdo, Byrd and Scott-Amundsen. It is operating Hallett jointly with New Zealand, Wilkes with Australia and Ellsworth with Argentina. Argentina and Australia have taken custody of Wilkes and Ellsworth.

Little America, considered the most important American base scientifically, has been closed because of lack of money.

• **Some planning**—The National Science Foundation has asked for $4 million dollars for FY 1960 for Antarctic research. The Navy has asked for nearly $16 million to provide logistical support.

No money is included for the nuclear reactors, the McMurdo landing field or a tracking station.

The reactors, which could be t ported by plane, are estimated to $3 million each.

Cost of building a 7800-foot field on the ground at McMur estimated at about $85 million. mated cost of a 10,000-foot ai capable of accommodating any j about $100 million.

The reactors would provide power for McMurdo, Byrd and S Amundsen bases, reducing the am of shipping to Antarctica by a half. The airfield would open Southern Hemisphere Great C route over the South Pole.

The polar tracking station w enable U.S. technicians to track satellites on every pass around earth. It also would serve as a c point for detecting unannounced silent polar satellites launched Russia.

Supporters of the tracking st proposal contend it would be only first step in the assumption of an portant role for Antarctica in Space Age.

They say Antarctica is the obv gateway to space because of the in the deadly Van Allen Radiation over the polar regions.

For this reason as well as scien and overriding strategic reasons are urging increases in the U.S. arctic effort.

Meantime, tractors bearing flags are moving through the Antar snows in increasing numbers. The sile submarines, then the missile s could come at any time.

Connector Reliability Improvement Is Urged

BALTIMORE—Electrical connec are an important part of any mis system. Many are in critical locati where their failure could cause fai of a whole system. Consequently, e though they are small and uncom cated, more attention must be gi to improving their reliability.

L. L. Resser and M. J. Sm engineers for The Martin Co., sented a paper at the AIEE meet here this month, outlining sev parameters that should be conside in connector design.

Some possible solutions suggest

• Double seals at the mating face of the connectors.

• Seals at the ends of the c nectors.

• Potting or single-piece constr tion of the insert proper.

• Snap-in contacts for cable-shi ing connections, with bonded foll up grommets.

NASA Patents Rights Debated

Question is how much proprietary interest should space agency retain over inventions performed under contract

ASHINGTON—How much of a ietary interest should NASA re- ver inventions conceived during erformance of a NASA contract? is question recently has been the t of strong debate at patent r meetings across the country, t waiver-of-patent hearings held ASA in Washington.

ASA held the hearings to give e and rocket industry patent rs a chance to voice their criticism e present interim regulations be- NASA drafts permanent regula-

fter the hearing, NASA General sel John A. Johnson stated that egulations would be modified after d his staff had an opportunity to the criticisms voiced by the in- y lawyers.

ASA's present regulations come fire from companies used to do- usiness with the Department of se because they are stricter than patent regulations. Conversely, ical companies used to contract- nder the very strict Atomic En- Commission patent rules find A's regulations very agreeable.

he missile and rocket industry oint is that NASA regulations d retain too many patents for the nment. NASA lawyers believe that nt regulations are not as harsh as try lawyers think, and that it is nterest of the United States" for A to retain proprietary interests me patents.

he effect of present NASA regu- s and the definition of the term he interest of the United States" oints much in dispute.

Here are complaints—Basic com- ts lodged by industry patent law- are:

. The regulations discourage indus- rom entering into NASA contracts use the decision as to who gets s to inventions is not decided un- ter the contract is signed;

. NASA keeps too many of the nts. All they really need is a non-exclusive royalty-free license to use the invention;

3. It is unfair to take an invention of one company and give the exclusive license for the production of that invention to another company;

4. The burden of proof is on the company to show why it should retain rights to its own inventions;

5. The regulations are not "in the interest of the United States" because in many cases the most competent contractor will refuse to accept a NASA contract under the current regulations.

• **Answers**—The NASA legal staff's answers to the above objections are:

If NASA's Administrator allowed the contracting officer to waive possible future patents in the contract, the Administrator would be surrendering his discretionary power, would put him in an untenable position under the law. Industry interest in NASA contracts has been high, indicating that the patent regulations do not discourage bids.

Because of the restrictions as to what type of patents NASA can retain, and because of NASA's pre-stated intention to administer the regulations liberally, fewer patents will be retained than many industry lawyers think. If NASA only retained a non-exclusive license on some inventions, it could not get risk capital to produce the invention.

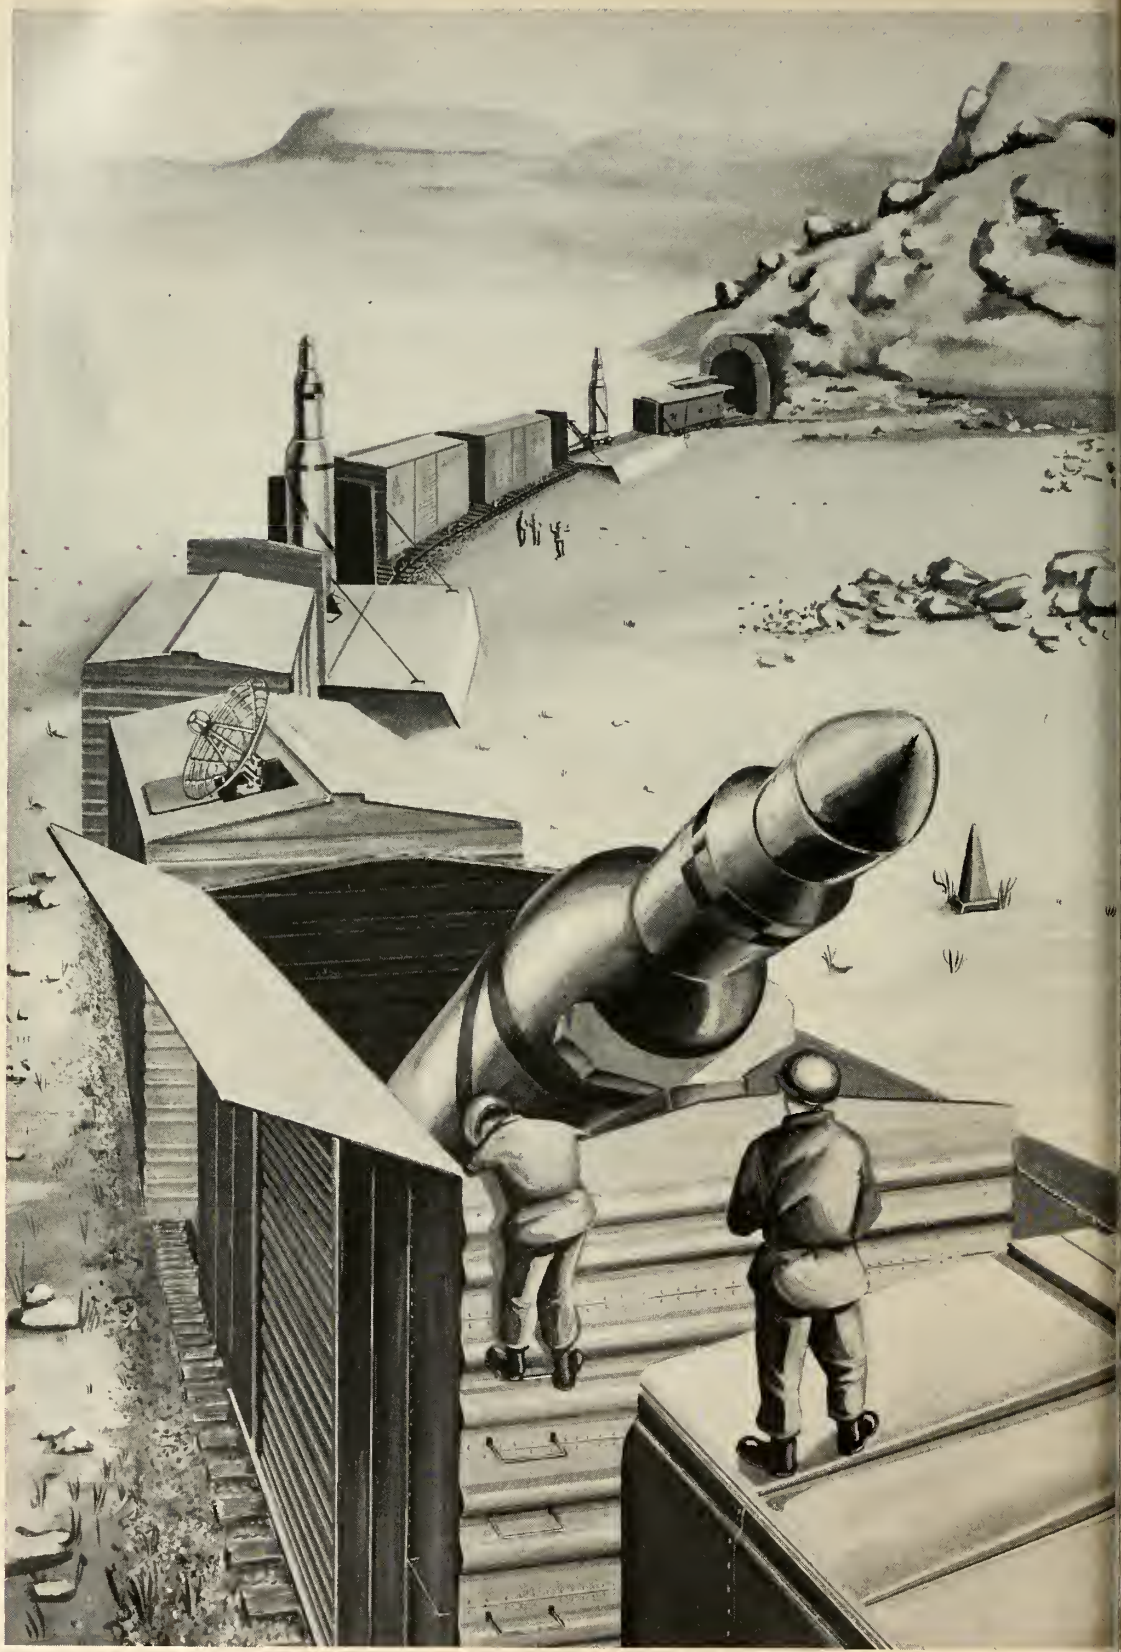
In many cases a contractor does not want to, or by law cannot acquire rights to an invention. NASA needs the power to give an exclusive license of one company's invention to another in order that the invention can be fully developed and produced in the interest of the United States.

The burden of proof on the contractor to show why he should retain rights to his own invention is very limited, and is necessary to carry out the provisions of the law.

The regulations, though in need of modification, are in the interests in the United States in that they allow the fullest development and use of important inventions in the area of space development.

• **Contrary policies**—NASA lawyers point out that the agency's patent provisions are stricter than DOD's because Congress made them stricter.

They point to the statement made recently by Administrator T. Keith Glennan in which he stated that: "Two such contrary patent policies followed by Government agencies working in closely related fields of research and development, can be detrimental to the kind of cooperation that we must have from industry, if our joint effort is to go forward with effectiveness and dispatch. We are well aware of the attitude of industry toward this question. On the other hand, it must be recognized that these rules are written into the law, and we cannot ignore them. The Administrator of NASA has authority to waive these patent rights, but only if his judgment tells him that such an action is clearly in the public interest."



• **Revision?**—Many industry and NASA patent lawyers think that Congress may revise the two organizations' patent regulations in order to reconcile them.

But NASA lawyers do not intend to ask Congress to do so. They feel that the provisions of the law are broad enough to allow them to work out regulations acceptable to industry.

Under the law, the Administrator has the power to waive patents, and the major dispute between industry and NASA is where to draw the line.

Industry would like inventions to be indexed into classes, with the waiver of patent rights by NASA on certain classes of inventions to be automatic. NASA counters that such a system would be infeasible in that an invention in any devised class or category could be so vital to the national interest that the government should retain proprietary rights.

The consensus is that the revisions NASA is presently making of its waiver-of-patent regulations will meet some, but not all of industry's objections.

Minuteman Rail Concept Pushed

200 missile trains appear possible which should open up a whole new field of missile support equipment running into multi-million dollar program

by William E. Howard

WASHINGTON—*Minuteman* is in the ess of being married to a boxcar.

mbracing the theory that mobility make the nation's ICBM deterrent knock-out proof, U.S. strategists well-advanced plans to mount the -fueled Boeing *Minuteman* on rails mouflaged as ordinary freight s, M/R has learned.

ntinually shunted around the try on secret schedules, missile s would be invulnerable to all but cky hit. The enemy would never for sure where they were. In time ert they could hide out in tunnels mine entrances.

he cars would be specially con- ted, perhaps "hardened" to 5 or psi, and air-conditioned to pro- the crew from radioactive fallout. trains would speed in time of at- to a pre-determined firing point g the track, or possibly a siding, nuclear-tipped missiles would be ched in moments directly from cars.

his concept of mobile task forces ing pushed hard by the Air Force. he time *Minuteman* is operational 963, its wedding to a train is cted to carve out a whole new of missile support running into ireds of millions of dollars.

t is possible that as many as 200 ile trains may be mobilized, re- ing special railroad cars and other ile handling and support equip- t.

On war game "sandtables" elusive ile trains add up to one of the t unstoppable weapon systems yet sed in the chill sweat to find an imate" deterrent to Russia. For in ition to will-o'-the-wisp deploy- t, they have the key tactical ad- tage of being able to fire from wn reference points. All targeting data would be "pre-cut" to benchmarks or mile posts strung beside the railroad track.

Thus, a boxcar-launched *Minuteman* would have all the accuracy, but not the vulnerability, of one in an underground silo, which can be zeroed in like a "sitting duck" by an enemy missile.

"Mobility and hardness are the two basic parameters," a high Defense Department planner told M/R. "The higher the degree of each in combination, the more difficult it'll be for the other fellow to knock you out. That's what is so important about this missile train concept.

"This is how it can be done—and should be done."

• *Titan* **mobility**—In the quickening drift toward mobility, M/R has been told, plans also are being developed by the Air Force Ballistic Missile Division to use barges, oil tankers and special truck task forces as ICBM launching platforms.

Moreover, considerable study is being given to adapting the liquid-fueled *Thor* IRBM and *Atlas* and *Titan* to one or more of these moveable platforms. Size and fuel handling are problems with the 90-foot *Titan* and 75-foot *Atlas*. However, a decision reportedly is in the mill at the Pentagon whether to go ahead with development of a storable liquid propellant for *Atlas*.

If one is devised, it could be a major step toward making both *Atlas* and *Titan* mobile. This could be a factor, too, in plans to build several billion dollars worth of underground ICBM bases, in addition to those under construction.

Fourth of a Series on Missile Support

Asked recently by a House Appropriations Subcommittee member if missile mobility is a "countermeasure" to the Navy's submarine-launched *Polaris*, former BMD commander Maj. Gen. Bernard A. Schriever replied:

"No. We are just getting tired of being accused of having our feet set in concrete."

Production of *Minuteman* presently is programmed at 2600 units and consideration is being given to making half of them mobile. If one train could handle six missiles, it would take 200 trains to mobilize 1200 *Minutemen*.

• **Cost factor**—Air Force authorities estimate that it will cost $1.5 million to put one *Minuteman* in a silo—including the missile, which is expected to come off the production line at about $750,000 apiece. Chief advantage of the fixed launching site is in lower maintenance cost. *Minuteman* was conceived as a second generation ICBM which, because of its solid fuel, can be deployed in squadrons of 60 in remote areas in tamper-proof silos under "black-box" surveillance—removing the requirement of crews to check on the condition of fuel, launch and guidance systems.

By utilizing existing rolling stock, the cost of putting *Minuteman* on rails would be comparable to a fixed system. But the cost of operating a train with a crew of 30 to 40 men would boost the overall annual outlay.

Research and analysis of the feasibility of mobile platforms, M/R has learned, was part of the proposal when Boeing was awarded the *Minuteman* contract last fall. To generate some broad parameters on performance and economics, a study was initiated and is still underway. Contributing, among others, are the Association of American Railroads and American Car & Foundry, one of the nation's largest railroad car manufacturers.

• **Two designs**—Studies thus far have produced at least two distinct designs, both centering around the launching car. In one detailed to some degree by the BMD, the missile car would be 110 feet long and capable of accommodating two 55-foot *Minutemen*. It would have a rounded, hinged cover under which the missiles would ride horizontally, protected by special cushioning gear.

For launching, the cover would be thrown back and the missiles raised to a vertical position on a ring stand. The car would be protected for possible re-use by a special blast deflector.

Remainder of the train would be made up of standard equipment.

The second, more elaborate concept calls for complete concealment in standard-appearing boxcars—so the train would be indistinguishable from another freight. This would make it that much harder for enemy agents to keep track of the train's whereabouts.

Since the standard boxcar averages 43 feet, the missile car would have to be specially tailored to fit the 55-foot length of *Minuteman*. This limitation probably would restrict the car to carrying one missile. To launch, the hinged sides and top of the car would fold out to the ground. As with the oversized double missile car, *Minuteman* would be raised on a ring stand with an electrically powered hydraulic lifting arm.

Extra shock absorbing effects are required in both designs to prevent damage to the missile while in transit. And the missile car decks and end panels probably would be fabricated of high-temperature resistant steel alloys to withstand takeoff blast.

More engineering and expense would be required to convert available rolling stock for a camouflaged missile train into cars to accommodate communication, telemetry and data processing, personnel and dining.

To harden the cars to withstand bomb blast over pressures of even 5 psi, some experts say, would run up the cost of the trains to an exorbitant figure. Moreover, they point out that hardening could not be very effective anyway, since it is more than likely a nuclear bomb blast at any proximity would knock a railroad car off its tracks. They contend it would be much more feasible therefore to run the trains into tunnels and mines during an alert.

• **15-car train**—A typical missile train of the camouflaged variety is conceived as being comprised of about 15 cars. They would include, in addition to six missile launchers, one car each for communications and telemetry-data processing, one for equipment, two for spare missiles, two personnel cars, a diner and—to make it look real—a caboose.

While no firm estimates have been made available, AAR figures indicate a fully-equipped missile car for a camouflaged train would cost in the neighborhood of $100,000—exclusive of the missile. A 110-foot car might be $150,000 or more. Cost of outfitting cars for personnel—$50,000 each. And the other cars also would have to be specially fitted and air-conditioned at about the same price. Thus a 15-car missile train would come to about $1 million. The diesel electric engine, if not leased from a railroad, would add another $250,000 for a total of $1,250,000.

In comparison, a luxury streamliner consisting of a two-unit diesel locomotive and 13 cars would cost $2.7 million.

Equipping the missile train communications and targeting cars along with other support equipment, however, might entail expenditure of another $1 million, bringing the total for one train ready for deployment with missiles to approximately $6.7 million.

This appears relatively cheap compared to a hardened *Titan* base, which costs about $40 million just for the brick and mortar to house personnel and silos for nine missiles.

• **Blocked tracks?**—One obvious drawback of a rail launching system is its inflexibility. In time of emergency, missile trains might be prevented from moving to their target control points by rail traffic, bomb damage or even sabotage to the tracks. This is one reason why some experts are in favor of a missile truck convoy which would prowl the nation's superhighways in continual readiness to respond to an attack.

Railroad authorities believe that through efficient planning and careful routing the drawback may be minimized. They point out that there is ample room on the sprawling rail network covering some 386,000 miles to "lose" a couple of hundred trains. Each day approximately 30,000 trains—half of them freight—are on the move over the country. This is approximately 50% of the trains operating in 1930 during the railroad heyday.

A prototype rail launching car for *Minuteman* is under development. Schriever says the Air Force is "going down the line simultaneously" on both the fixed and mobile operational concepts.

First firing of *Minuteman* from a silo could come late next year—either at Cape Canaveral or at Edwards AFB. Facilities are being built at both. And the first shot from a boxcar may be scheduled at the same time.

New Transducer Uses Seen in Space Medicine

PHILADELPHIA—Space medicine have issued a transducer challeng the electronics industry. At a Phil phia's Franklin Institute sympos medicine experts pointed out that and better transducers are neede provide the answers that medicine have to know if man can surviv space. And they are looking to tronics to provide the means to s and transmit the many physiolo parameters they must measure.

The one-day Space Medicine E tronics Symposium brought toge representatives of medicine and tronics in industry, the armed fo and government agencies.

To date, communications bet electronics and medicine has been little to produce any significant re The Philadelphia meeting was an e to bring about better communica and acquaint electronics with s medicine problems.

Theodore Kaslow, vice presiden gineering of the Decker Corpora defined the ideal transducer and po out three parameters that are espec important to medicine and are, t beyond the state of the art:

1. An objective measure of threshold and level;

2. An objective measure of ness, or awareness; and

3. A measure of cerebral cir tion.

Some work has been done by Decker Corporation on the cer circulation problem. Preliminary using an opthalmic artery pulse pi indicate that techniques and transd can be developed to provide the swers needed.

Present medical methods of ob ing physiological data—skin and temperatures, pulse and respiration blood pressure, skin resistance, action, etc.—are too crude and l to be used on a man in a space ronment. The subject's comfort, matic pickup and recording/tran ting capability, volume and weight itations, and other requirements al tate entirely different techniques equipment from those used in the tor's office.

Gordon Vaeth of ARPA said "we cannot prove today that ma survive and perform in space." H that in spite of the feeling by som man is an obsolete and expensive h in a space vehicle, he feels that has a function to perform that c be accomplished by machines.

He pointed out that man is the complete and flexible computer able today and can serve as a efficient data filter or discriminat

How Is DOD Moving on Reliability?

Some observers say it is in all directions but Air Force has come up with a new reliability monitoring system which should give better standards

by Betty Oswald

WASHINGTON—Reliability is rapidly ›oming the most important headache ·d both by the Defense Depart·t and the National Aeronautics and ce Administration. The old slogan 9.44% pure just isn't good enough the thousands of pieces and sub·ems which make up advanced pons and space systems.

But how do you achieve reliability? ense Department, according to e observers is moving in all direc·s at one time. However, effort ts for the most part at design level er than at the level of materials ch make reliability of design components themselves feasible. ether this is good enough is furi·ly debated among research people, icularly those who are concerned a the failure to develop a firm ma·als research program looking ahead a new generation of requirements.

Latest DOD effort deals with en·ering drawings and associated lists M-D-70327) which spell out in e 25 pages exactly what shall be the engineering drawings, and how erials, parts and components are to identified. And to "insure quality design activity (either military or ufacturer) is required to establish maintain an adequate procedure checking, review and maintenance rawings, associated lists, and docu·ts prepared or furnished under this ·ification."

• **New monitoring**—And the Air ce has developed a reliability mon·ing program designed to correct as ckly as possible situations such as recent development of "bugs" af·ing the *Atlas,* which resulted in r faulty firings in a row.

The policy statement is contained AFL 84-1. It is predicated on the mption that "reliability is a param·" that can be quantitatively speci·, estimated, assessed or measured at designated steps or monitoring nts of a weapon system's life cycle ." It recognizes, however, that in·ased funding will be required, in e cases, to obtain higher confidence els in the demonstration testing se.

AF's program is supplemental. It does not replace contractor's normal reliability monitoring as well as surveillance by AF contracting agencies. It is based on an expression of quantitative contractor reliability (i.e. 50% at a certain date, 95-100% by another date).

Reliability monitoring points established by the AF are: (1) Detailed design study, which includes studies of both system and subsystem reliability covering the entire design and including prediction of reliability wherever feasible; (2) Pre-prototype, involving design engineering inspection or a release of nearly all of the engineering; (3) Prototype, at which time laboratory testing has established compatibility of weapon systems and subsystems and special test vehicles have been used to obtain data for improvement of design, etc.; (4) Pre-production demonstration. Here sufficient reliability must be shown to warrant a production go-ahead; (5) Service evaluation. Here the question is whether the system is capable of being produced in quantity without significant loss of reliability or performance; (6) Full-scale production, during which the effort is to assure that the level of reliability designed into the system is maintained; and, (7) Product improvement, during which AF hopes to move close to the perfect.

• **Reliability specified**—At each of these points, the degree of reliability required will be specified in the contract. At each of these points the status of reliability is to be reviewed and, on the answers found, a determination will be made whether to move to the next step in the life cycle of the weapon.

However, it's uncertain whether this latest program is good enough. Indications are that there will be more emphasis on the bits and pieces which go to make up the missile system, and perhaps somewhat less emphasis on the complete weapon system. This means more technical development work as recommended by the Stever Committee which recently reviewed the status of the Air Force research effort.

Thor Plastered

TECHNICIANS coat nose cone of *Thor-Able* re-entry vehicle with plaster to make cast of its surface. Vehicle is first to be recovered after successful flight over 5000-mile ICBM distance. Avco's Research and Advanced Development Division developed ablating heat shield material which protected cone from extreme temperatures encountered during re-entry into earth's atmospbere. (Dark substance behind cone is ablative material which flowed back over main body during re-entry heating.)

Swiss Firm Turns Out Most Missiles in Italy

Contraves AG developing into big supplier with its RSD-58 and RSC-57 missiles

by Anthony Vandyk

ZURICH—Contraves AG, which is developing into one of Europe's most respected missile manufacturers, is a Swiss firm which turns out most of its products in Italy.

The head office and plant of Contraves, a component of Switzerland's Oerlikon-Buehrle industrial empire, are located in a suburb of this great manufacturing city. But production is mainly handled by an Italian subsidiary company, Contraves Italiana.

This unusual arrangement is a result of Switzerland's traditional neutrality. Swiss policy does not encourage the export of armaments—and the market within the country is extremely limited. Furthermore, since Switzerland is outside NATO, prospects for a Swiss company trying to sell its products to NATO member countries—the main European military market—obviously are not good.

• **No Red business**—These factors were behind the decision of Contraves to set up Contraves Italiana in Rome. Using the design of prototype facilities of the Swiss organization, Contraves Italiana as an Italian company is in an excellent position to obtain orders from NATO countries. The Contraves organization also takes orders from countries outside NATO but has a policy of not doing business with Iron Curtain countries.

To date, most of Contraves' missile business has come from the Italian and Swiss governments, but there have been token orders from the U.S., Japan, and Germany. Contracts are being negotiated with other countries.

The U.S. Air Force was Contraves' American customer. It evaluated the Swiss anti-aircraft missile at the Holloman Air Development Center in 1953.

Because Contraves missiles are developed without government financing, the company's salesmen are not hampered by security in their efforts to sell their products on the world market. There are no aspects of the *RSD-58* and *RSC-57* SAM's or the *Mosquito* SSM which cannot be freely discussed with potential customers.

Contraves makes no attempt to avoid talking prices. The tactical *RSD-58* version of the anti-aircraft missile is priced at between $15,000 and $18,000 per round, while the training *RSC-57* version costs roughly twice as much. The anti-tank *Mosquito* is tagged at $900 in both its training and tactical versions.

• **"Against birds"**—Now able to offer two highly competitive types of missiles on the world market, Contraves has come a long way since its foundation in 1936 as a modest anti-aircraft research organization (Contra-Aves means "against birds"!). The first products that stemmed from its work were tracking systems; from the original pre-war models were developed complex theodolites, which form the basis of the Contraves EOTS (Electronic Optical Tracking System), standard equipment at the leading missile ranges of the Western World. More than 100 sets of EOTS equipment have been sold by Contraves.

Another Contraves specialty is fire control equipment. The Fledermaus probably represents the ultimate in this type of equipment for anti-aircraft guns. Experience in this field obviously has aided in perfecting fire control systems for Contraves missiles.

The Japanese Self-Defense Force expects to fire its first Contraves anti-aircraft training missile this summer. The Swiss company has concluded a licensing and agency agreement with Mitsubishi Electric Manufacturing Company of Tokyo. Prospects are good that the Self-Defense Force will place a production order with this conce Under the terms of the agreem Mitsubishi can sell Japanese-built n siles to any neighboring countries cept those in the Communist bloc.

• **Heavy subcontracting**—Contra policy favors maximum subcontract and most of its anti-aircraft missile s tem is manufactured by subcontracto Much of the radar comes from Alt werke, a Zurich electronic compa that was one of Contraves' early ba ers. The beam guidance radar conta a HF transmitter made by another Swiss company, Brown Boveri. Forei companies also figure in the Contra program. For example, Belgiu MBLE company is responsible for t target-tracking radar.

Although the basic Contraves SA is not new, constant improvements being made. Operating radius has be increased to over 20 miles and a so

CONTAINER with two missiles weig only 23 lbs. and is strapped on bac

ppellant is being substituted for the crrently-used liquid-fuel rocket mo-t. The present motor develops about 200 lbs. thrust and combustion lasts about 45 seconds, sufficient to move t missile up to Mach 2.5,

A particular selling point made by Contraves officials is that since neither t SAM nor the little *Mosquito* SSM e boosters they can be deployed close t inhabited locations and troop con-ntrations.

One of the main features of the Contraves SAM system is its mobility, c imed to be at least as great as that c a normal heavy-caliber anti-aircraft a illery battery. The heaviest of the ssile battery's units weighs only 12,-00 pounds. Nonetheless, the *RSD-58* t tical missile can attain Mach 2.5 d has an operating radius of over 2 miles and a ceiling of 30 miles.

The minimum distance at which i can be used is from 8000 to 16,500 et, according to the speed of the t get. Launching weight is about 900 s. The warhead contains about 90 s. of high explosive. Behind it is an ectronic equipment also weighing out 90 lbs.

• **Fast firing**—The beam guidance stem permits several missiles to be ed simultaneously from the same bat-ry. Up to twelve missiles a minute ay be launched. This high rate of fire quires fast loading on the double unching ramps; this is largely achieved rough automation.

The training version of the *RSD-58,* e *RSC-57,* is fitted with a parachute stead of a warhead and thus is not pendable. The recovery system in-udes two parachutes and special echanism. After the end of combus-on, the missile is split into two parts, the nose and the main body returning to earth separately. As many as ten recoveries have been made with individual missiles tested at the Italian Air Force's range on the Mediterranean island of Sardinia.

• **Anti-tank**—Contraves is working very closely with the German firm of Bolkow in connection with its program for the little *Mosquito* anti-tank missile. This wire-guided SSM competes in a market so far dominated by France's Nord *SS-10* and *SS-11* missiles.

The Swiss-designed SSM is considerably smaller than the French weapon and weighs only about 23 lbs. A container with two missiles including warhead that can be strapped on to a soldier's back (see photos) weighs only 54 lbs. Guidance equipment weighs 8 lbs. Despite its modest size (3 feet long and 2 feet in wing span) the *Mosquito* has a remarkable performance. It travels at 16,500 ft. per minute and has an operating radius of about 6000 ft.

Although the missiles of its own design are tops in their category, there is little doubt that Contraves would be extremely interested in acquiring the license to build advanced birds of foreign design. Notably missing from the company's catalog is an AAM in the *Sidewinder* category.

It could well be that by the time the Swiss Air Force is ready to make its choice of a supersonic fighter, probably this fall, Contraves will have a proposal regarding the weapon system. In all events, it seems that the company's success with its past projects guarantees it a permanent place among the leaders of the European missile industry.

CONTRAVES *Mosquito* SSM uses boosters that can be deployed closed to inhabited locations and troop concentrations.

S. K. Hoffman Receives M/R's Goddard Trophy

WASHINGTON—Samuel K. Hoffman, vice president and general manager of the Rocketdyne Division of North American Aviation Inc., last week was awarded the Dr. Robert H. Goddard Memorial Trophy—an annual presentation by Missiles and Rockets.

The award was made at the end of a three-day National Missile Industry Conference sponsored by the National Rocket Club. Hoffman was honored for leadership in producing the *Jupiter C* liquid rocket engines which launched the first U.S. earth satellite *Explorer I,* on Jan. 31, 1958, and engines for the first successful flight of a long-range ballistic missile, an *Atlas.*

An industry award presented by Borg-Warner Corp. also cited Rocketdyne for outstanding achievement with liquid-propellant engines.

Dr. William H. Pickering of Jet Propulsion Laboratory received the Daniel, Mann, Johnson & Mendenhall Space Flight Achievement Award.

Space Industries Small Business awards were presented to: Cooper Development Corp., Monrovia, Calif., for design and fabrication of the three final *Jupiter C* stages used in the *Explorer* series; and Cincinnati Testing Laboratory for developing the first successful IRBM re-entry nose cone.

Other Highlights—During one of the work sessions, Dr. Herbert F. York, the DOD's director of R&E, reported that the ARPA-Army cluster of eight *Jupiters* for *Saturn's* space booster will be effective if only seven of its motors ignite. York also forecast a need for more research money for NASA and DOD as the astronautics program diverges more from the missile program.

"Off-again-on-again" Pentagon plans for a nuclear-powered plane (CAMAL) were critized by Sen. Henry M. Jackson (D-Wash.), a member of the Armed Services Committee and long-time supporter of the project. Jackson challenged whether development of the plane would take five years, as estimated in recently released Congressional testimony by Lt. Gen. Roscoe C. Wilson, Air Force deputy chief of staff for development. The Senator thinks it could be done sooner, and that the first one should be a seaplane.

And William S. Palmer, vice president of Templeton, Dobbrow and Vance, Inc., mutual fund managers, cautioned that prices of missile stocks have reached "unrealistic" heights because of "wild speculation."

U.S. May Seek Pact to Silence Outworn Satellites

Delegation at Geneva meeting will also propose radio frequencies to be reserved for space use only

by Paul Means

WASHINGTON—Future U.S. satellites containing permanent power sources will house destruct mechanisms allowing their transmitters to be turned off when their usefulness is over.

An attempt to obtain an international regulation to this effect may be made this August at the Radio Conference of the International Telegraphic Union at Geneva, which will also take up the problem of the allocation of frequencies for space use.

The problem of permanent power sources in satellites first arose when the Navy launched *Vanguard I*. The satellite's batteries were charged by solar cells, allowing it to send signals back to earth ad infinitum.

Because of its almost perfect orbit, *Vanguard I* still provides useful information to the nation's scientists. But when the value of its information is ended, there will be no way to turn *Vanguard I's* transmitter off.

And a great many satellites in space with permanent power sources would clutter up valuable frequency bands for many years to come.

The next two satellites with solar cell-charged batteries that the U.S. intends to orbit are *Thor-Able III* (the paddle wheel satellite) and *Explorer VI*.

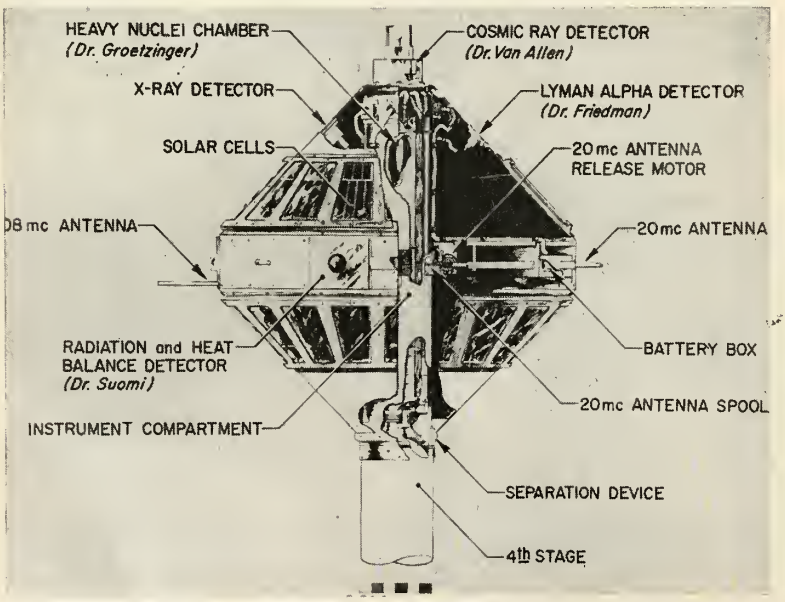
A destruct mechanism in *Thor-Able III* will not be necessary because its orbit (30,000-mile apogee, 150-mile perigee) will be short-lived. But *Explorer VI*, a long-life radiation experiment satellite, will contain either a destruct mechanism which will turn the transmitter off, or a device allowing the transmitter to be turned off and on as information is needed. Its power will be supplied by solar cells charging nickel cadmium batteries.

A satellite transmitter's signal can be terminated by: (1) a circuit breaker; (2) by applying too much volt to a transistor, allowing the oscilla to burn it out, or (3) by using a ti fuze.

Because some satellites in sta orbits will give useful information fr time to time in years to come, NA and ARPA scientists are also perfe ing a device that would allow the tra mitter to be turned on and off as formation is to be required.

• **Space bands**—Another probl created by the Space Age is the fir ing of frequency bands for space u in a radio spectrum already burden by military and commercial commu cations.

The U.S. proposal before the 1(nation International Telegraphic Uni will be that 25.600 to 25.650 mc., reserved for the exclusive use of spa transmissions. This band would used for earth-space transmissio fixed service transmissions (radio a television network satellites), mob service transmissions and space-to-spa transmissions.

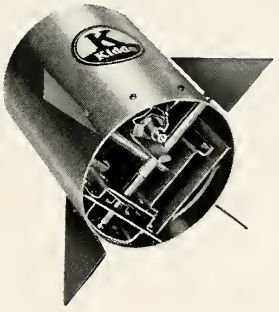


Recognizing that space operatio will demand more frequency bands the future, the U.S. proposal will al request that the following bands al be set aside for space use: 1700-17 mc.; 1825 to 1850 mc.; 2275 to 23 mc.; 8300 to 8400 mc.; 15,150 15,250 mc.; and 31,500 to 31,800 m

The U.S. proposal requests that t latter frequencies be used primarily f ground-to-space station, and space-t space transmissions. The propos would not exclude fixed and mobi service uses of these frequencies pr vided this would not hamper spa vehicles and stations in communicati with each other and the ground.

• **Hopeful outlook**—Since the Sovi Union is the only other space powe what are the possibilities of effecting a international agreement allocating fr quencies for space?

U.S. officials think chances a pretty good.



They point out that internation agreements become difficult to effe

PAYLOAD of *Explorer VI* will contain a transmitter powered by solar cells. Plans call for a device to either shut off or control output of the transmitter at will.

Don't miss it!

Be sure to see the working models of the new Kidde hot and cold gas servo systems at the Western National Astronautical Society Exposition of the American Rocket Society at the El Cortez Hotel in San Diego June 9 to 11 Booth 83

Kidde hot and cold gas servo systems can be tailored to fit a wide range of applications. Illustrated above, rocket guidance control. They are low in cost, light in weight. Kidde gas servo systems have low current and gas consumption, have few moving parts, and are extremely reliable. They operate at temperatures exceeding 1600° F.

Kidde's hot and cold gas servo system components have been developed, tested and are now on the shelf. If you have a problem involving servo valve systems, write for complete information to Kidde today. Chances are we already have the answer.

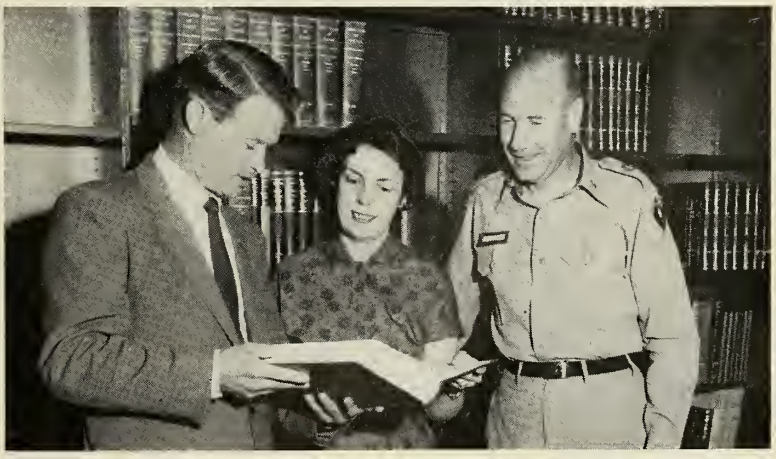
Improvement of vapor phase deposition of chromium, molybdenum and tungsten is reported by Alloyd Research Corp., Watertown, Mass. Possible electronic industry applications include component coating with high-purity, high-density tungsten to prevent contaminants in base materials from adversely affecting electronic emission characteristics. Thicker "coatings" raises possibility of fabricating thin electronic parts of refractory metals. Heavy coating of tungsten on graphite also may be feasible for improving heat characteristics of rocket nozzles.

Space balloon to probe atmospheric density at 300 miles will be launched soon by Air Force Cambridge Research Center. Boosted by *Arobee* and *Sparrow* rockets, balloon will be ejected in 18-pound package, which will unfold into 9-foot mylar plastic sphere reinforced by dacron threads. Inflation will be accomplished by evaporation of ethyl alcohol followed by capsule discharge of freon gas into plastic struts inside the balloon. System was designed by Arthur D. Little Co.



Prime contract has been awarded Marquardt Corp. by Air Force to expand its effort on project *Pluto*—joint AF and AEC feasibility study of nuclear ramjet engines.

Fast tax write-off certification has been granted by the OCDM to Bendix Aviation for missile R&D—60% of $1 million; Hughes Aircraft for electronic systems R&D—65% of $400,000; Lear Inc. for R&D and production of missile components—60% of $1.9 million.

Mergers & Expansions—Royal Industries has acquired Pacific Electronic Controls Corp., Monravia, Calif., potentiometer maker . . . Machlett Laboratories Inc. stockholders and those of Raytheon Inc. have approved merger conditions . . . Hewlett-Packard Co. has initiated $1.9 million in building construction for a planned $2.7 million expansion at Stanford Industrial Park, Palo Alto, Calif. . . . 28% more plant space will be added by Sperry Electronic Tube Division of Sperry Rand at Gainsville, Fla., to expand production of microwave tubes. Employment will be boosted by 30% to more than 800 by mid-1960, the company says . . . Electronic Communications Inc. is building a 150,000-square-foot manufacturing plant at St. Petersburg, Fla.

Russia, says National Bureau of Standards Director Allen V. Astin, is leading the "entire world" in high-temperature development. And equally important in the Missile Gap, Astin says the U.S. is behind the Soviets in industry-wide verification of industrial and scientific instrument calibration. He says Russians have established a network of calibration centers for the mandatory interchange of data about technological components.

SCOUTING THE FRINGE OF SPA

5 manned research vehicle rehearses for first flight

by Erica M. Karr

If all goes according to plan, the *X-15* will have made its first powered flight before the next two months are up. The hybrid rocket-plane, offspring of a nationwide project involving over 300 companies—large and small—recently completed its fourth captive flight test and is expected to undergo a glide-flight landing test within the next two weeks. First space-fringe flight to 100 miles is due "sometime next year," according to prime contractor North American Aviation, Inc.

Primary role of the *X-15* is to get data on actual flight conditions beyond the atmosphere and the effects on man and machine during exit and re-entry. To do the job the vehicle will carry over 1300 pounds of instrumentation involving approximately 600 temperature pickups and 140 pressure pickups.

Minor bugs have been worked out of the system during an extensive ground testing program and the captive flights have proven out all systems except the engine. During these trial runs, the *X-15*, locked under the wing of a B-52, has been under continual surveillance by two television cameras in the mother plane which has taken the manned space bird to 42,000 feet at Mach .8.

The mated combination has been checked out for aerodynamic characteristics while North American's design engineer and test pilot, Scott Crossfield, checked out the control and communications systems from the cockpit during simulated launch.

Although Crossfield will take the 50-foot ship through final flight test phases,

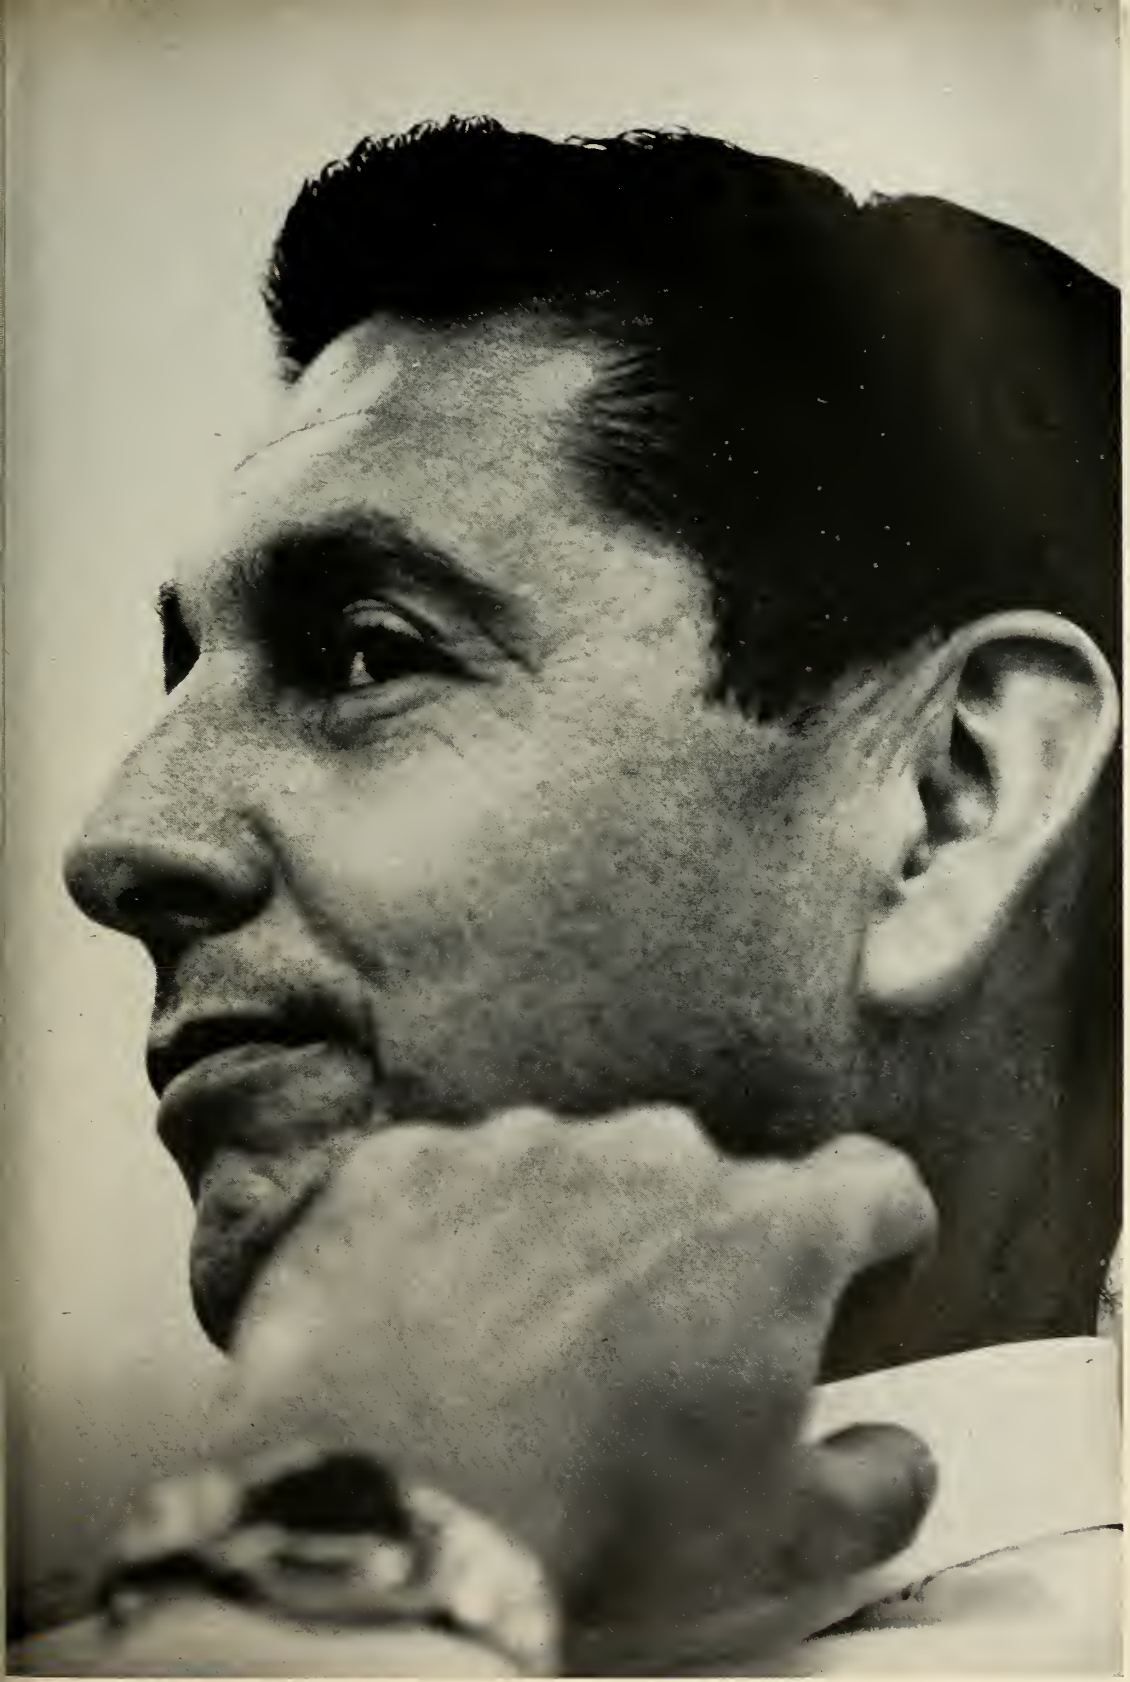
---

NEEDLENOSED *X-15,* being readied for captive flight test under B-52 wing, is fed helium gas which is chilled by passage through liquid nitrogen of minus 320°. Nitrogen, which boils at this temperature, causes ground fog. Chilling gas increases fuel load.

Another Exclusive
Cornell Capa Picture Story

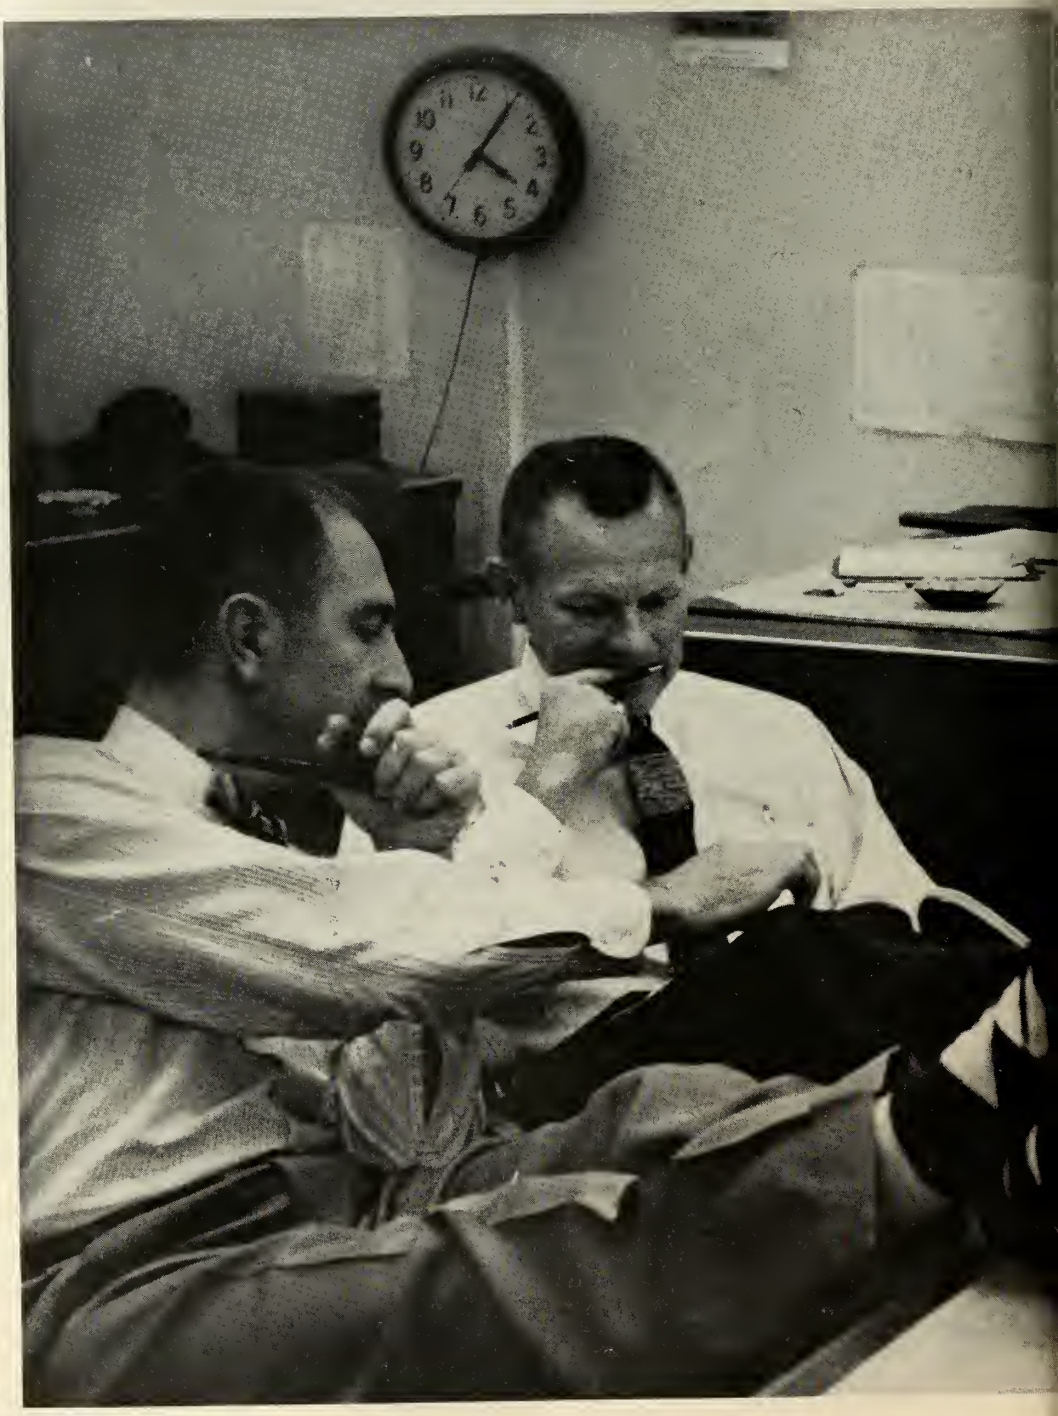
. . . two faces of one man

Air Force Maj. Bob White will probably be the man who will nose the *X-15* in and out of the atmosphere on its first full flight.

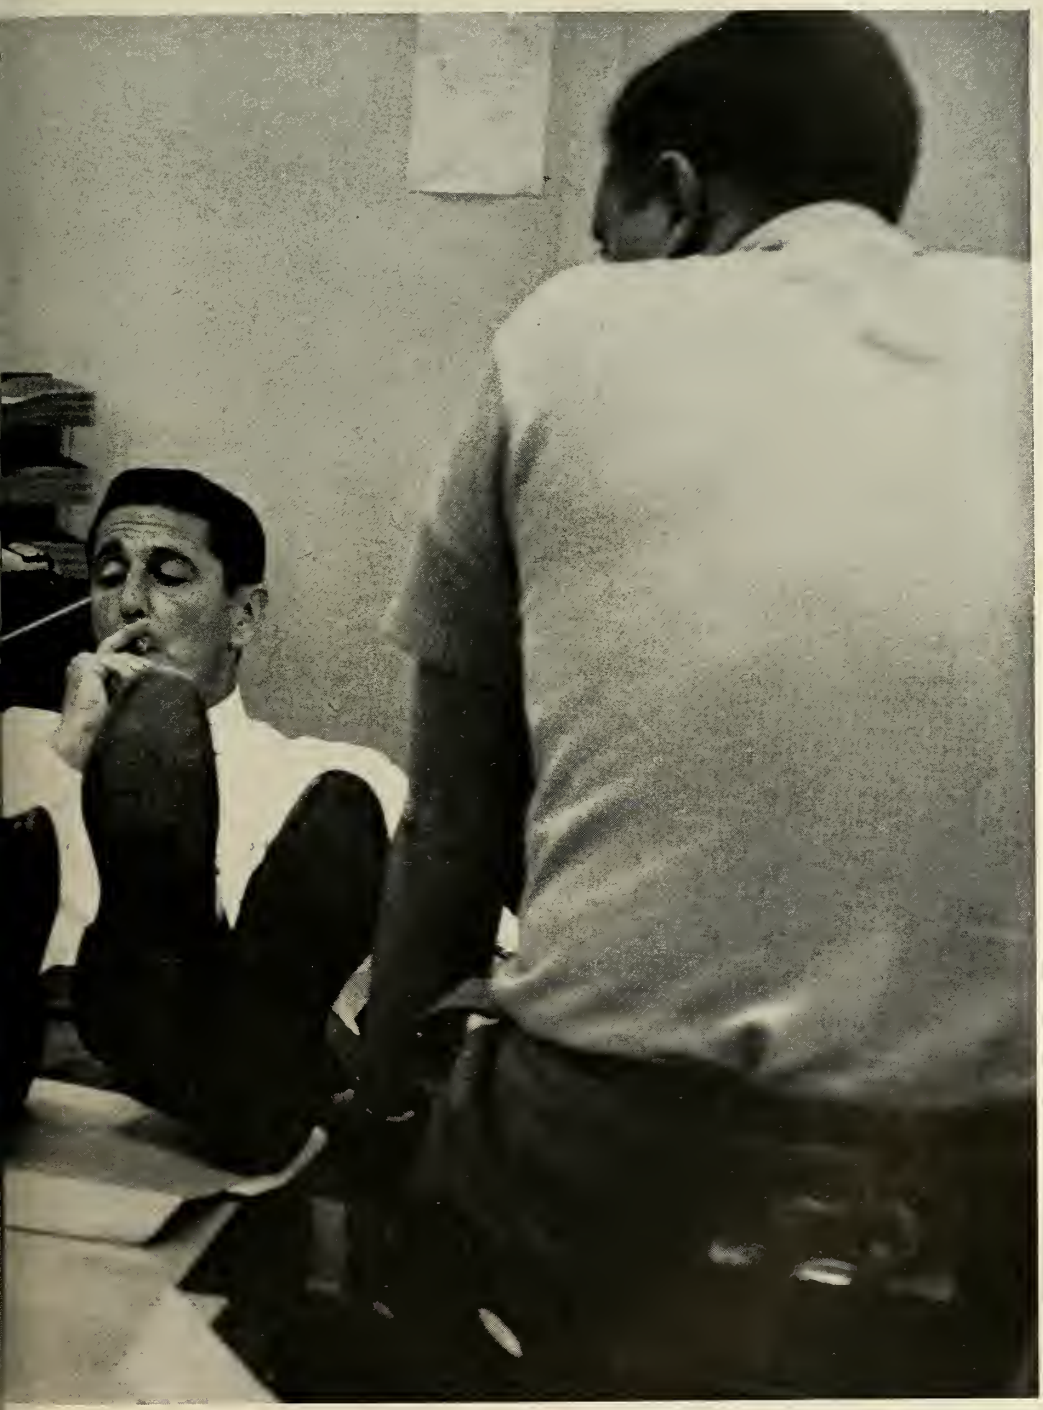


In this unusual account, the camera of Photographer Cornell Capa has caught behind-the-scenes highlights before, during and after a recent captive flight, culmination of the over 3½ years' work to date in bringing the *X-15* to the threshold of proven reliability.

Crossfield, who has lived with the program since its inception, often putting in 100-hour weeks toward its realization, and the *X-15* both will undergo their stiffest test to date in the glide-landing run. Falling vertically with an initial speed of 100 mph, and moving with a ground speed over 400 mph, Crossfield will have about two minutes to test control responses before he tackles the tricky problem of landing.



Among major contributors to the program which is expected to cost over $120 million through the third vehicle: Reaction Motors Division of Thiokol Corp. supplies the liquid propellant powerplant which will boost the *X-15* to 4000 mph. Auxiliary power units come from General Electric's Accessory Engine Division. Garrett Corp. makes the liquid nitrogen cooling and pressurization system. Pressurization suit, tested by Crossfield in the captive tests, was developed by a brassiere and girdle manufacturer, the David Clark Co. The nickel alloy—Inconel X—from International Nickel Co. will bring the *X-15* through the high temperatures of re-entry.



Ballistic rockets for out-of-the-atmosphere control come from Bell Aircraft, while Sperry Gyroscope developed the in-flight electronic indicator system to transmit altitude, speed and angle of attack to the pilot and recording apparatus. Instrumentation, much of it produced by Lear and NASA, will have a temperature environment provided by a system developed at AiResearch Mfg. Co.

DISTORTED FACE of test pilot Scott Crossfield reflects terrific pull of 4 g's forward and 7.33 g's down in *X-15* re-entry simulation. Right: The normal Crossfield face.

. . . Relaxed conference with vital implications

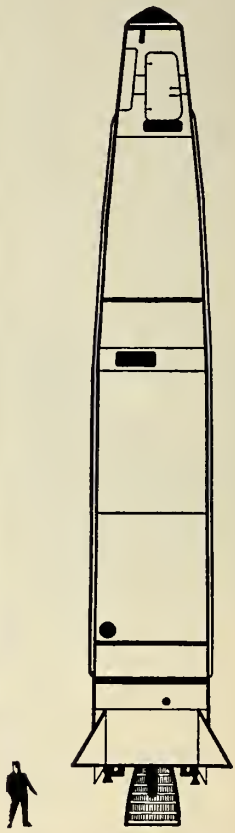
FEET ON DESK, North American's Sam Richter, flight test engineer; Q. C. Harvey, test operations supervisor; Crossfield and Bill Berkowitz, launch panel operator, discuss countdown procedure for new *X-15* test.

TOWER WATCH. Assistant project engineers Raun Robinson and Bud Benner watch captive flight while tuned in on radio with control unit.

***X-15* PILOTS,** present and future, Joe Walker, NASA; AF Capt. Bob White, LCDR Petersen and Scott.

NASA, Air Force and Navy pilots will put *X-15* through paces where NAA's Scott Crossfield leaves off.

Final checkout on suit and machine, ready for takeoff . . .



The man:

. . . a launch-control specialist in a *Thor* SAC squadron. His instruments report each automatic step in the launching procedure of the big IRBM. U.S. Air Force and Royal Air Force missilemen are receiving *Thor* training side-by-side . . . have readied and fired these missiles within a 20-minute count-down.

The missions:

. . . are many—because of the Douglas *Thor's* versatility. As a highly mobile weapon with atomic capability, it sternly warns potential enemies against aggression. As a powerful and reliable booster, it is playing a leading role in our exploration of outer space with satellites and probes.

The missile:

. . . can destroy targets as far as 1500 miles away within minutes after hostile action is detected. Douglas *Thor* missiles were the first intermediate range ballistic missiles to be deployed overseas. The United Kingdom has announced the delivery of the first *Thors*, for operation by Royal Air Force personnel.

The Nation's Partner in Defense

Simple Solion May Fill Low-Frequency Gap

Very small and lightweight, solion gives high sensitivity, low power input. Here lead wires are welded on integrator.

by Charles D. LaFond

WASHINGTON—The solion, a liquid-state device, is one of the newer additions to the electronic components field providing one more link in the evolution of dynamic circuit elements. Employing ions in solution as a charge carrier, the solion contrasts sharply with vacuum tubes and transistors in which the charges are transported by electrons.

Much research has been devoted to development of solion technology, but the art is still in its infancy with respect to application. So far, the solion has shown some very desirable attributes not now available in either electron tubes or transistors. A rapid summary of some of the virtues of solion units will readily explain why interest is spreading.

• **Strong points**—Solions, for low-frequency use, require low voltage and no power (0.9V dry cell supply and lowest of all devices produced consume 10-15 milliwatts standby). They are highly stable (with some exceptions), long-lived, rugged, light and compact.

They can provide high amplification and circuits free of electrical circuit memory. When they are used as detectors, flows as small as 10^{-5} milliliters/sec. can be indicated and pressures as low as 1 dyne/sq. cm. will get a response.

Finally, they are simple in design, easy to manufacture and uncomplicated in operation.

• **And drawbacks**—Solions also have certain characteristics and limitations that will confine their use. They are restricted to low-frequency applications. They are unique technologically and designers require sound electrochemical knowledge. They are sensitive to temperature change, vibration, and position (these can be anticipated and compensated). Current manufacturing facilities including mass-production machinery are either limited or nonexistent.

• **Description**—The simplest type of solion (the term is generic) is a sealed unit containing two electrodes immersed in an electrolyte—the whole functioning as a diode. Configurations vary with the role. In general, the electrodes are fabricated from platinum or other noble metal. Serving as conductive surfaces only, they are not a part of the electrochemical reaction.

The electrolyte most commonly used is iodine-potassium iodide. It provides a reversible system (redox) wherein there is never a net change in any solution component—only local concentrations vary at the electrodes.

Highly sensitive to low-level stimuli, the solion is most suitable for low-frequency (0-200 cps) applications. Requiring from 0.01 to 0.001 the power required for transistors, research indicates that within its frequency range it may be more efficient than transistors.

Reason for the frequency limitation is the inherently high ratio of the ion mass to that of an electron (in an iodine solution, the ratio is about 233,000:1). On the other hand, since vacuum tubes and transistors are not used at such low frequencies—that is, without burdensome circuitry—the solion fills the gap.

• **History of solion**—The idea of concentration polarization, determined by Nernst in 1904, is a foundation of solion technology. The principle is basic to the consideration of polarography and a primary strut in the theories of electrochemical overvoltage. Basic quantitative theory in these areas has achieved wide dissemination in European technical publications and behind the Iron Curtain.

Dr. D. S. Muzzey, Jr., then of Shell Oil Company, first studied the effects of using an electrode in a solution for acoustic and pressure transducers.

Later studies during World War II at the U.S. Naval Ordnance Laboratory (NOL), Silver Spring, Md., demonstrated the reversibility of an iodine-iodide closed system.

Following proof of feasibility for practical solion units, the Emhart Manufacturing Company of Hartford, Conn., successfully completed a contract for the Navy Bureau of Ordnance to manufacture some small units.

Pioneering in early applications of the solion, National Carbon Company, a division of Union Carbide Corporation, together with Texas Research Associates has been developing a whole line of experimental solion components.

• **Basic principles**—All of the so-called liquid state devices are electrochemical units, and certain common fundamental laws or theories govern the phenomena associated with each. To better understand the function and operation of a solion device, a few of the more dominant concepts should be reviewed.

In a galvanic cell, the voltage measured at the point of zero current flow in an electrode is called reversible potential. Applying an emf with an increasing current to one electrode will eventually cause the measured potential to change from the reversible potential. The amount of this voltage deviation from the reversible potential is the overvoltage; the electrode is considered to be polarized.

Overvoltage is a function of chemical processes at the electrode and can be considered as the result of three different processes: (1) Activation overvoltage is caused by a too-slow chemical reaction; (2) Film overvoltage results from formation of an insoluble film over the electrode surface. Actually the film serves as a resistance in

the circuit and results in a proportional voltage drop; (3) Concentration overvoltage, or concentration polarization, is caused by an electrolytic diffusion rate that is too slow at the surface of the electrode.

In an electrochemical system the rate of diffusion serves as a current limiter since the current flow is proportional to electrode area, salt concentration, and the diffusion coefficient of the cation or anion under consideration. This limit, the diffusion current, is proportional to the concentration of the solution. (Polarography is an analytic technique using this knowledge of specific diffusion currents for different compounds in solution.)

It follows then that to make use of the concentration polarization, the solutions must be affected with an external force in a manner associated with function of the particular solion device; that is, disturb the solution to alter or upset the diffusion layer, or force the flow of different concentrations of solution in juxtaposition about the same electrode.

Finally, two additional phenomena should be discussed. Between a solid surface and a solution there exists a state of electrical imbalance. An "electrical double layer" of ions is distributed along the boundary. Oppositely charged ions are tightly bound to the will move with respect to this surface. The result is a situation similar to a charged parallel plate condenser, although the potential drop perpendicular to the surface is not as sharp as in solid surface, but a few farther away a condenser. The ions in motion have a net charge opposite to that of the fixed ions.

To utilize this phenomenon, capillary tubes can be used to permit a net charge in this second layer significantly high with respect to the rest of the solution. Considering only one tube and providing that electrodes are located at the tube ends, with an applied potential, the fluid will be moved in one direction by a phenomenon known as electro-osmosis.

• **Progress to date**—What has been accomplished so far with solion? Early research at NOL and DRL indicated feasibility of the following: an electrochemical readout integrator, a low-frequency acoustic flow-detector (with logarithmic response and full range of at least 80 db), a micropump, an amplifier (with amplification factor of 300), and product units.

The solion is still considered experimental by the company, which has not yet decided to move to commercial production. High on their list of potentials is their electrical readout integrator. (Samples are available to other companies interested in the present or future use of solions.)

As described by National Carbon Co., the following is a list of anticipated uses for their existing solion components:

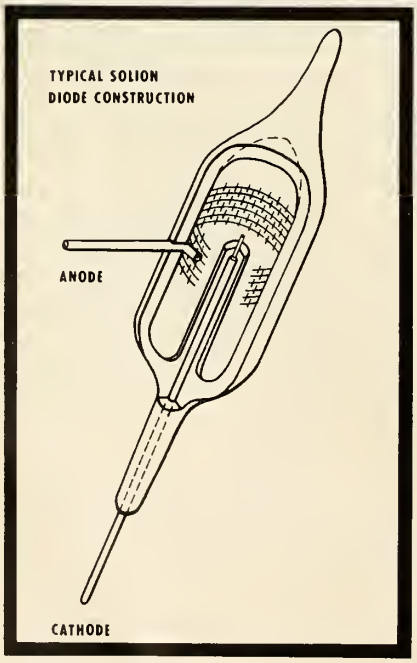
• **Solion Electrical Readout Integrator (SERI)**—

(1) Integration of output from tomatic product analyzer to deter necessary input correction.

(2) To sense temperature and duce error signal for correction o put through control circuit.

(3) Very-low-frequency ampl (to dc) for use in control circuits.

(4) Integration of output from vironmental sensors of various for use in routine testing and in term rocket or missile flights.



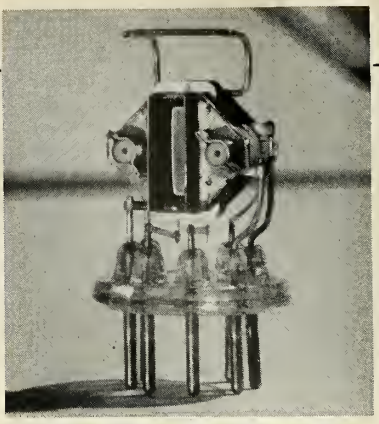
• **Solion Visual Readout Int tor—**

The solion visual readout integ has much larger integral capacity the SERI and the ability to retain integral for several months to an a racy within 5%. This type unit is ently being used to integrate the ou from a microphone in a noise meter.

• **Solion Detectors—**

The solion flow detector prod small electrical currents in respons applied pressure at frequencies bet 0.001 and 200 cps. The functi form of the relation between cu and pressure can be varied over a range by proper electrode config tions. One type of solion detect presently being used experimentall detect low-frequency acoustic signa water. Another type detector is b used in an experimental accelerom

The Emhart Manufacturing Co the first manufacturer for the N has the production know-how for lion fabrication. Company spokes have indicated that it is still too to predict future commercializatio solions.



CHARACTERISTICS of solion integrator, left; circuit arrangements employing concept, right.

PROPOSED SOLION CIRCUIT COMPONENTS

DEVICE	FUNCTION	BLOCK DIAGRAM
Diode	Switch, rectifier, clipper	
Pressure Transducer	Converts pressure to voltage—linear function	
Pressure Transducer	Converts pressure to voltage—exponential function	
Osmotic Pressure Transducer	Converts electrical input to pressure output	
Derivative Unit	Converts pressure to voltage—rate function	
Derivative Unit	Output voltage proportional to the derivative of input voltage	
Product Unit	Output voltage proportional to the product of input current and pressure	
Product Unit	Output voltage is proportional to the product of two input currents	
Integrator	Output voltage is proportional to the integral of input current	

Tubes and Transistors: Where Do We Stand?

M/R survey shows that if anyone wins 'battle' it'll be to benefit of entire industry

SYLVANIA's stack tubes combine advantages of glass and ceramic.

by Hal Gettings

WASHINGTON—If anyone wins the le" between tubes and transistors ust be the electronics industry as a e. The development and phenomeprowth of the transistor has served oaden the scope of electronics and nce the state of the art at a faster than ever before. The tube industan thank the transistor for giving kick in its transconductance and ng it make some unprecedented ress of its own.

Tubes have seen many significant ovements made recently. The istor, the ceramic tube, coldode, Sarong, and other innovations served to cut down on many of vacuum tube's shortcomings. Transrs, too, have jumped ahead to new ibilities with the new high-temperagallium-arsenide semiconductors, solid-circuit modules, the erroney-named "molecular electronics," more rigidly controlled production niques.

In spite of the fantastic increase in number of transistor units sold year, the receiving tube has lost ground. Indeed, more tubes are cted to be sold in 1965 than before. The obvious conclusion is the market is expanding at a rate parable to the transistor's growth.

• **Intelligent design**—At the risk of necessarily elaborating on the obs, the only solution to the problem tubes vs. transistors is intelligent ification and design. This seems to he consensus of the industry and rnment representatives, design eners, prime contractors, and conants contacted by M/R editors to lve the problem.

The day may sometime come when engineer can crank all the desired acteristics, application, size, weight, shape of a proposed system into a computer and come up immediately with an answer as to what circuits and components to use.

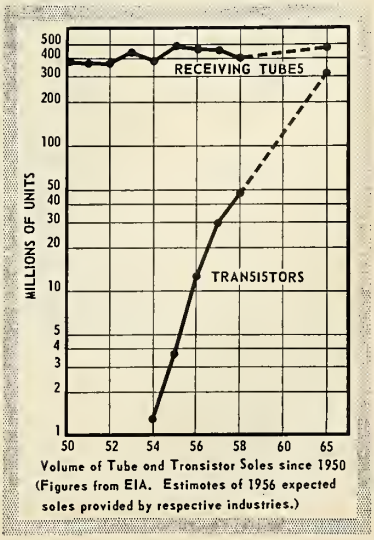
Until that day, however, this work must be done by man. And for that man to do a satisfactory job on the design he must know and consider many things.

Two facets of this "intelligent" approach seem to have particular merit:

1) All factors must be thoroughly considered before specifying or designing either tubes or transistors into a circuit;

2) Consideration must be given to marriage of the two when advantages can be gained by so doing.

The first point requires that the final decision be made as far down the line as possible. The design engineer who must, in the end, tie the circuit together and make it work, should be given as much freedom as possible in making the choice, subject to other factors in the system or circuit design.



And he, of course, must make his decision based on a thorough study of the problem and the best solution. Ideally, such a man should be entirely objective in his choice; he should have no preconceived notions as to one being better than the other.

• **Hybrid techniques**—Possibly one of the greatest relatively unexplored possibilities is that of using hybrid techniques: designing tube/transistor combinations to take advantage of the best features of each. Some little has been done here—Motorola has a hybrid automobile radio that reportedly is a good basic design—but undoubtedly much more can be accomplished. Such an approach may solve many problems and open up new areas not even considered before.

There are, of course, many applications where nearly everyone agrees that transistors are the answer. Where

GE's solid-state thyratron can switch kilowatts of power in microseconds.

Volume of Tube and Transistor Sales since 1950
(Figures from EIA. Estimates of 1956 expected sales provided by respective industries.)

size and weight and power dissipation requirements are of first importance—and are not overweighed by other factors—then transistors can unquestionably do the job.

They have been proven in computers, battery-powered devices, underwater communication cable amplifiers, dc-dc and dc-ac converters, audio amplifiers, etc., where their obvious advantages make them first choice. Transistors' main selling points—small size, light weight, efficiency—can certainly be used to advantage in today's requirement for things smaller, lighter, and cheaper to build and operate.

Currently, IBM is developing a prototype transistorized SAGE computer under an Air Force contract. This unit will reportedly have seven times the computation capability of the present unit and will be only about 10% its size. Some thought is being given to ultimately transistorizing the entire SAGE installation.

• **Transistorization buys**—In a paper delivered last week at the National Telemetering Conference, Max A. Lowy, Data Control Systems, Inc., made an interesting comparison of identical transistor and vacuum tube 16-band FM/FM telemetry systems.

A condensed summary of his findings are shown in the table. His conclusion is that transistorized systems are more expensive, but this extra money buys reduced volume, reduced weight, better performances, and higher reliability in this particular case.

Other things being equal, the transistor has been and will be the obvious choice between the two for its size, weight, and power advantage. Not ; however, nor in the foreseeable fut can it do everything the tube can It's a mistake to expect it to an greater mistake to try to force it to jobs beyond its capabilities.

Ideally, it would seem that should be able to draw a graph: h are the parameters within which tube is best, here the transistors, ; here either or both. Unfortunately, question is not that simple. Altho frequency, heat, power, radiation, ; any number of other considerati influence the choice between the t the lines cannot be sharply drawn.

Much propaganda has been put by both tube and transistor manu turers. Both are competing for a m ket and their respective claims m be, to a certain extent, subject Consider some of the areas stres by one or the other and see if definite conclusions can be reached

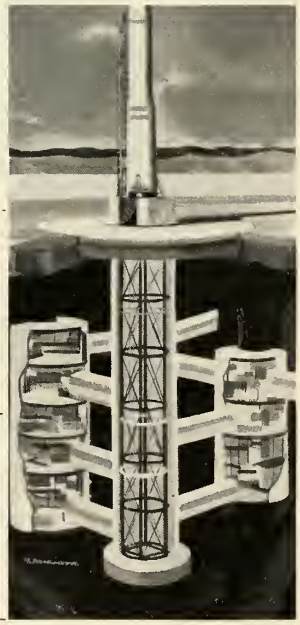
• **Reliability**—So many factors e into considerations of reliability t generalities cannot be easily defi Both tubes and transistors have formed well in rugged applicati where the initial design and packag techniques were good. At the hig temperatures and over wide ranges signal and power levels, tubes defini hold an edge. Under extreme envir ments, transistors are generally c ceded to be better. Especially after initial operating period, transistors sh an exceptional stability over long t periods. Some variation of characte tics has been shown by transistors a relatively long storage.

• **Radiation**—Tube manufactu argue that transistors are inhere much more susceptible to high-ene gamma radiation, and this is t Transistors have been subject to m more radiation testing than tubes, h ever, and more data is available. In dition, the semiconductor makers p out that the tolerance levels of so state devices are as high and someti higher than those of other circuit c ponents and personnel.

• **Noise**—In applications wh noise is an important considerat tubes definitely are the choice. Tran tors have an inherently higher n figure.

• **Size and weight:**—Here the t sistor is indisputably king so long the advantage is not thrown away compensatory or protection circuits.

• **Temperature**—Transistors are more sensitive to temperature variati than tubes and cannot operate at higher temperatures (over 200°) or c wide ranges with reliable stability. P ress is being made in this area, h ever, by such devices as Texas Ins ment's gallium arsenide diode wh operates up to 325°C.



COMPARISON OF IDENTICAL VACUUM TUBE AND TRANSISTOR TELEMETRY SYSTEMS

	Vacuum Tube		Transistor

• **Impedance**—Low-impedance cir-ts definitely favor transistors. High edance (over 200 ohm) requires es. A wide range of both input and put impedance is available with es.

• **Frequency**—Transistors are gen-ly suitable only at the lower fre-ncies. With careful selection and, in e cases, compensation, satisfactory formance may be obtained even up 300 mc. Generally speaking, of rse, power is universely proportional requency.

• **Power dissipation**—The transistor ere, again, the acknowledged leader. ecially in huge computer installa-s, where the cooling load is tremen-s and a cooling equipment break-n could be critical, transistorization rs many advantages. It must be re-nbered, however, that transistor cir-ry must sometimes also be temper-e-regulated and that it is much e sensitive to even relatively slight ations.

• **Voltage**—Tubes are definitely the ice where higher voltages (over v) are used and where the circuit is ect to surges and transients. Where sistors are used under adverse con-ns, some of their advantages must sacrificed for protection of the ipment.

• **Uniformity**—Tubes justly claim ormity and interchangeability as of their significant advantages. nsistor manufacturers admit that ormity of characteristics is hard to ntain. For critical applications, users forced to reject from one-tenth to half of production-run lots. Even elected groups, a 2 to 1 spread in is not unusual.

• **Power**—At the lower frequencies nc and down) tubes and transistors considered about equal. Tubes are e suitable at the higher power rat-. Power transistors sacrifice some antage with cooling measures.

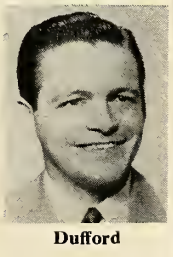
There are perhaps just as many, or e, "tube" men as there are "tran-r" men. The rapid progress of elec-ics leaves no room for engineers or specification writers with prej-es and preconceived notions who there is only one way—theirs—to a job. The industry feels it can't d specifications calling for transis-ing at any price; neither can it d obsolete designs that use tubes because they were good enough last .

The strongest conclusion that can drawn from these "facts" is that ner tubes nor transistors can claim significant overall advantage over other—which goes back to the or-al statement that an intelligent de-n as to which to use must be based ntelligent appraisal of all the factors.

people

Louis N. Ridenour, Jr., vice president and general manager of Lockheed Aircraft Corp.'s Electronics and Avionics Division, died suddenly here last week. Death was from natural causes. He was 47 years old.

Dr. Ridenour had some to Washington to act as chairman of the National Aeronautics and Space Administration's Science Advisory Committee on Navigation, Guidance and Electronics. He presided at the two-day organization meeting.



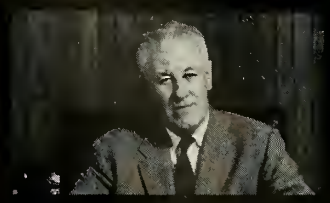
Ridenour

Internationally known for his work in both nuclear physics and electronics, Ridenour was a member of the Air Force's Scientific Advisory Board, heading up the electronics panel. He was first chief scientist of the AF. In 1950-1951, he headed a special committee which surveyed the AF's science and research effort. The report which bears his name was considered responsible for creation of the Air Research & Development Command and the organization of the deputy chief of staff (development). The report is also considered the basis for current attempts to revitalize ARDC.

During World War II, as assistant director of the Radiation Laboratory at Massachusetts Institute of Technology, he was instrumental in development of airborne radar and radar bombing systems. For this work, he received the President's Medal of Merit.

Ridenour was the author of a number of scientific books, as well as many technical and non-technical papers. He was a member of the American Physical Society, the American Association for the Advancement of Science, the Institute of Radio Engineers and the American Rocket Society.

Donald E. Dufford has been named head of applications engineering at Genesys Corp., manufacturers of digital process control computer systems. Dufford earlier was associated with Autonetics, Marquardt Aircraft, and previously the Telecomputing Corp.



Dufford

To meet numerous requests from readers, M/R has made available reprints of the recent series of articles by Dr. S. Fred Singer on the meaning of Project Argus. Copies of the combined series may be obtained by writing to the magazine. The rate is 50¢ for a single order (bulk rates on request).

A Personal Invitation to

ENGINEERS

from ROBERT McCULLOCH

President

"If you would like to be a member of a select corps of Engineers, working for an interesting, growing company . . in one of the country's most stimulating areas . . I invite you to write to Temco. Temco's growth is sound and planned, its products are diversified and challenging, our facilities are modern. Every benefit, for you professionally and in good living for you and your family, is here. Below are some of the areas in which jobs are open now."

INSTRUMENTATION

Graduate Electronics Engineer or Physicist to perform analysis and design of instrumentation, telemetering, and other data-gathering components for use in missile and electronic system test programs. Individual will develop the instrumentation system concept, make decisions on the most practicable types, application, and arrangement of equipment, and perform actual design of components, circuits, and linking of the entire system.

AUTOMATIC CONTROLS

Graduate Electronics, Mechanical, Aeronautical Engineer, or Mathematician or Physicist to perform analysis and design of automatic flight control equipment and corresponding missile stabilization mechanisms. Individual will be responsible for analyzing the performance characteristics of particular configurations and developing motion-sensitive electronic apparatus and servo-mechanisms to provide the necessary control-surface corrections and make guided or directed flight possible.

Help us solve
the problems of

ION PROPULSION

Our Advanced Design Group is seeking engineers and scientists to work on low-thrust propulsion systems that will make possible the manned exploration of Outer Space. These are a few of the challenging positions:

Theoretical Physicist

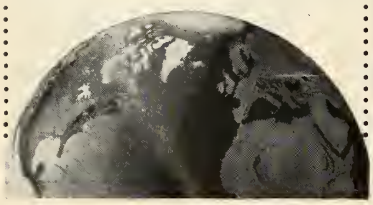
Experienced in the field of particle physics, magneto-hydrodynamics and plasma physics, comparative performance of electrical propulsion systems, new methods of developing thrust from electrical propulsion systems, and direct conversion processes.

Chemical Physicists

To make studies on propellants for ion propulsion. Experienced in electronics, atomic physics, and physical chemistry.

Physicists

Primary activities will be in the field of ion sources and high vacuum techniques. Experienced in particle accelerators, ion sources, and electronics.



Electrical Engineer

Analysis of electrical power generators, preliminary stages designs of permanent magnet, AC induction and electrostatic generators.

Please write: Mr. D. F. Jamieson, Engineering Personnel Dept., 6633 Canoga Avenue, Canoga Park, Calif.

ROCKETDYNE

A DIVISION OF NORTH AMERICAN AVIATION, INC.
FIRST WITH POWER FOR OUTER SPACE

contract awards

NAVY

$11,000,000—**Remington Rand Univac, Div. of Sperry Rand Corp.,** for an advanced computer to be used aboard ship.

$800,000—**FXR, Inc.** Woodside, N.Y., for high-voltage supply for classified AN/SPG-55A shipboard radar set (subcontract from **Sperry Gyroscope Co.**).

$500,000—**Gladding, McBean & Co.,** Los Angeles, for production of ceramic radomes (contract awarded by **Raytheon Mfg. Co.**).

$292,431—**Loewy-Hydropress Div. of Baldwin-Lima-Hamilton Corp.,** New York, for services, labor and material to fabricate and test one complete warhead handling system, prototype for *Talos*.

$136,544—**McKittrick Construction Co.,** Huntington Park, Calif., for construction of technical services engineering facility at Point Mugu.

$64,560—**Hazeltine Corp., Electronics Div.,** Little Neck, L. I., N.Y., for 48 man months of field engineering services in the installation and operation of APA-127 and ASA-23 missile launching accessories in F3H-2 aircraft.

ARMY

$1,038,000—**North American Aviation, Inc., Rocketdyne Div.,** Canoga Park, Calif., for secret item for ARPA.

$977,941—**Cubic Corp.,** San Diego, for research and development for electronic measuring system.

$881,599—**Douglas Aircraft Co.,** for *Nike-Hercules* components, *Nike* repair parts and classified material (three contracts).

$513,248—**Ryan Aeronautical Co.,** San Diego, for research and development for target missile.

$455,237—**Western Electric Co., Inc.,** New York, for *Nike* spare parts and components, (three contracts).

$200,000—**California Institute of Technology,** Pasadena, for research and development to be performed at the Jet Propulsion Laboratory.

$173,238—**Rheem Manufacturing Co.,** Downey, Calif., for design and development work.

$164,703—**Bridgeport Brass Co.,** Riverside, Calif., for inside tube remover.

$125,000—**North American Aviation, Inc., Rocketdyne Div.,** Canoga Park, Calif., for missile spare parts.

$86,900—**Wiancko Engineering Co.,** Pasadena, for data systems components.

$85,809—**Wiancko Engineering Co.,** Pasadena, for eighteen items of oscillators, linearity controls and pressure pickups.

$75,470—**Allegany Instrument Co., Inc.,** Cumberland, Md., for multi-component static test stand.

$73,850—**The Firestone Tire & Rubber Co.,** for engineering services.

$71,174—**Gilfillan Brothers, Inc.,** Los Angeles, for engineering services and *Corporal* missile spare parts (two contracts).

$70,000—**Polytechnic Institute of Brooklyn,** for basic research on performance comparison of various system satellite re-entry.

$59,882—**Dow Chemical Co.,** Tulsa development of procedure for c ing *Jupiter* suction lines and tank

$51,565—**Consolidated Electrodyna Corp.,** Atlanta, for nine items of vanometers, CEC type.

$46,060—**Aerojet-General Corpor** Azusa, Calif., for study-process o hesive bonding.

$44,172—**Preshaw and Thompson,** Van Nuys, Calif., for spare parts.

AIR FORCE

$3,000,000—**International Business chines Corp., Military Products** for components of the AN/A bomb navigational system used o B-52G.

$2,500,000—**Melpar, Inc.,** Falls Ch Va., for flight simulators and re equipment.

$1,742,500—**General Electric Co.,** J son City, N.Y., for component automatic flight control systems the F-105D and the F-105E.

$470,000—**Curtiss-Wright Corp.,** S Barbara, Calif., for aerial t drones, launch rail adapters and equipment of the *GAR-8* missile.

$391,000—**Consolidated Systems C subsidiary of Consolidated Electr namics Corp.,** for propellant-uti tion-system exercisers to be use *Atlas* program at Vandenberg (subcontracts from RCA).

$233,099—**Block Associates, Inc.,** C bridge, Mass., for research dire toward the design, development testing of small rocketborne spe radiometer systems.

$233,000—**Leeds & Northrup Co.,** P delphia, for precision potentiom and accessories.

$215,000—**Gladding, McBean &** Los Angeles, for further research development on ceramic radome

$196,706—**Convair Div. of General namics Corp.,** San Diego, for pr PR 59-1131, SA #7. This is an crease in funds.

$76,631—**J. W. Frecker, Inc.,** Pittsbu for equatorial table to be use support of project 5177.

$76,253—**Consolidated Controls C** Bethel, Conn., for miscellan switch-pressure consolidated contr

$63,000—**Kuthe Labs., Inc.,** Newark, N for electron tubes.

$53,669—**Olin Mathieson Chemical C Chemicals Div.,** Baltimore, for n tethyl hydrazine for testing and ev ation in support of Weapon Sys 138A.

$53,667—**Tektronix, Inc.,** Portland, O for miscellaneous oscilloscopes, amplifiers, tubes and standard spa

$51,525—**Westinghouse Electric Corp.,** mira, N.Y., for miscellaneous elec tubes.

$40,243—**Grand Central Rocket Co.,** lands, Calif., for rocket motors t used in support of Project 7850.

The Marquardt Corporation's AST Div. has been awarded a prime cont for expansion of its efforts on Pr *Pluto*. (Amount not disclosed).

opulsion engineering

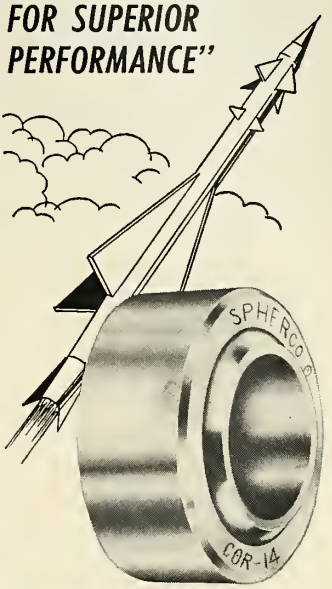
Vary the thrust to get optimum performance from a nuclear ket, say C. J. Wang, G. W. Anthony and H. R. Lawrence of Space nology Laboratories in the current (May) *ARS Journal*. They the thrust should be variable, and programmed, to take advant- of partial molecular dissociation and then recombination of gase- propellants. Dissociation drastically increases specific heat which gives an I_{sp} greater than normally expected by using the square- -of-temperature law.

There is "an optimum way of programming the thrust to fulfill articular mission" of a nuclear rocket, the Space Technology a says. Dissociation characteristics of gaseous propellants now idered potential nuclear rocket propellants are such that this ossible: At a given temperature, decrease the operating pressure, consequently the thrust, and you will increase the specific impulse.

'Energy communicated to the rocket at burnout of the total gy injected into the rocket system" is a maximum under their d theory. Wang, Anthony and Lawrence discuss a case where ciation of the gaseous propellant was taken into consideration, a program of varying thrust was designed. Their conclusion: e optimum thrust program results in much better performance the usual constant thrust operation."

Another unconventional propellant situation is analyzed in detail he same *ARS Journal*. A team formerly with Food Machinery Chemical outlines all the important physical properties for the gen tetroxide-nitric oxide system from minus 100°F to 0°F. This ne of the systems most highly touted to become an important izer in prepackaged, storable liquid engines. Presented for the time: Vapor pressure, density, viscosity, surface tension. To e the data more valuable to designers of rockets and equipment, as taken on *commercial grades* of the mixed oxides. For workers want it, Donat B. Brice, now with The Fluor Corp., and man Fishman, now at Stanford Research Institute, include de- d drawings of their apparatus.

Trapped free radicals will give up all their secrets, or at least National Bureau of Standards will make every effort to force them at the Fourth International Symposium on Free Radical Stabili- on late this summer. Theme of the meeting, to be held Aug. Sept. 2 at NBS in Washington, is "Trapped Radicals at Low Tem- atures." Deadline for preregistration forms was March 25, however . 1 is the deadline for getting a short communication into the ussion part of the program. Nature of these brief reports should ent to Dr. A. M. Bass, National Bureau of Standards, Wash- n 25, D.C. So far, the program includes tours of NBS labora- s participating in the free radical work, and these discussion cs: Low-Temperature Chemistry, Method of Production of pped Radicals and Physical Properties of Radical-Trapping Solids, tity and Concentrations of Trapped Radicals, Future Trends in e Radical Stabilization, Interaction of Free Radicals with Solids.



Shape of refractory plugs influences their durability, a Russian ker notes. Not a surprising conclusion, but I. Sh. Shvartsman ls this out in detail in *Ogneupory*, Vol. 22, No. 4. He says longi- nal cracks develop in screw plugs with thick-walled spherical parts. s does not happen in the case of bolt plugs with thinner, lighter erical parts, he reports.

Low-cost corrosion inhibitor for refrigeration and cooling systems be sodium molybdate, now that the price barrier has been crashed research. Sodium molybdate always has been an excellent— expensive—corrosion inhibitor in these systems. Climax Molyb- um chemists now say it can be mixed with very small amounts orthophosphate to achieve full inhibiting action. Result: A ller amount goes a longer way.

letters

Optik Goes to London

To the Editor:

I have read with much interest in the April 27 issue of M/R the proposal for standardization of velocity terms in astronautics and the suggestion of "Optik" put forward by Major Mannix.

This is to advise you that at the IAF Congress to be held in London in September this year, I will raise this important question.

Meanwhile, I have prepared a memorandum which I intend to discuss with Mr. (Andrew G.) Haley, President of IAF, at the end of this month, when he will be in Rome.

Glauco Partel
President
Terminology and Classification
Committee
IAF
Rome, Italy

Praise for Optik

To the Editor:

Cheers for Major William C. Mannix on his new proposal for a space velocity unit in the April 27 issue! Already the aerodynamicists have almost captured the field with their thoroughly incongruous unit of "Mach Number" based on the velocity of sound in air. This term obviously has no meaning in free space and worst of all is utterly dependent on the temperature of the medium. While its use is admittedly of value in aerodynamic problems, it is practically worthless in kinematic analyses or ballistic problems.

We should act quickly and energetically to adopt a unit of absolute velocity to alleviate somewhat the hopeless situation which has developed in English-speaking countries in regard to dimensional units.

For example, engineers use a horrible conglomeration of units, horsepower, slugs, foot-pounds, pounds-force, pounds-mass, BTUs, cu. yards, rods, miles, yards, acres, sq. mi., knots, kilowatts, gals. (both U.S. and British), feet/sec., m.p.h., Mach No., tons (short and long), barrels, fathoms, bushels, etc., ad infinitum, ad nauseum.

The wonder is that British and U.S. engineers have ever been able to develop anything with such a hodge-podge of units. How many hours are wasted in tedious conversions?

Scientists generally use the metric system although even here the physicist uses the centimeter-gram-second system while the meteorologist uses the meter-kilogram-second system. There are other variations in use. Perhaps the engineers and the scientists would work more closely together if their systems of units were made more nearly uniform.

Take the matter of charts used for navigation and aerial flight. Long distances are usually in nautical miles, short distances in yards, heights in feet, and depths in fathoms. The units now employed for velocity are as numerous as there are combinations of units for length and time.

The unit of "Optik" proposed by Major Mannix fulfills the requirements suggested by Messrs. A. Hurlick and E. B. Bell at the Second Symposium on Hypervelocity Impact Effects in 1957. It is referenced to a natural phenomenon and one as nearly absolute in a quantitative sense as is possible. Furthermore, the subdivision of making the basic unit one-millionth of the velocity of light permits the statement of all velocities in convenient quantities.

The name itself, "Optik," is a natural. Since the world is becoming smaller and people closer together, because of the increase in velocity of travel, the word should be one easily recognizable in all languages.

Certainly the final "k" is a small concession to be ask of English-speaking peoples. Names such as "Roemer" should be avoided. This name is at home only in German-speaking countries. With all due respect, the choice of "Roentgen" for a unit of ionizing effect of high-energy radiation is unfortunate because of the difficulty of pronunciation by non-German-speaking peoples. In sum, the name "Optik" not only denotes its origin, but should be easily transcribed and pronounced in any language on earth.

I vote loudly for the adoption of the term and its definition by all engineering and scientific professions.

John O. F. Dorsett,
Captain, USN (Ret.),
Johns Hopkins University,
Operation Research Office

'Furlong per Fortnight'

To the Editor:

In response to the recent proposal by Major William C. Mannix (M/R, April 27), concerning a unit of velocity, I suggest that we bestir ourselves now, while on the threshold of the Space Age, and adopt a different unit for velocity. It is the "furlong per fortnight." Although the unit appears to be somewhat illogical, I believe it will satisfy our need for having the largest of everything (somewhat lacking in satellites of late).

Thus, our satellites will be reported as having an orbital velocity of 47,000,000 furlongs per fortnight as compared to the insignificant 18,000 mph.

viet affairs

by Dr. Albert Parry

In what patents can we find descriptions of fuels needed in ketry? Who in the world is making a carburetor for a certain fuel? What metal alloy is necessary for this or that machine that the machine or a vital part of it would work well under n conditions? Man should be able to get quick and complete wers to such questions by just telephoning a central office where ecial machine would have the solutions to all the problems which e been solved anywhere on earth. The need for such an "inform- n machine," to be built on the latest findings and inventions in tronics, is discussed at length in *Izvestia* by Professor L. enmakher.

He points out that the limit of human absorption can be reached a man if he reads 12 hours a day for 50 years at the speed of words per second, finally totaling 18,000 books of 300 pages n. Yet the already-accumulated printed works of mankind are e than 50 million titles. Patents registered in all the world's ntries exceed 5 million. The world's annual output of books and nals is nearly 200,000 titles. Scientific, engineering and technical rmation on hand is growing at a terrific rate, thanks to the in- ant work of the world's 500,000 scientists and many millions engineers and technicians.

The world's treasury of all this information is "more valuable n any reserves of gold, diamonds, or uranium," the Soviet pro- or declares. The problem of its proper utilization is far more plex than any problem of ore mining, he continues. Scientists adays know more and more about their steadily narrowing cialties, and "the ever-expanding terminology of these narrow ls separates experts of adjacent fields even more than any such sion can be caused by foreign languages."

The Soviet scientist proposes that in the future whatever gets ted be simultaneously processed electronically into capsules for new information machine. The Soviets must lead the world once e, by being first to build this information machine, the Russian fessor insists. He writes: "If the creation of ordinary writing and invention of the printing press served as the foundation of contemporary civilization, then the future invention of what may called machine writing will be characteristic of the epoch of mmunism."

Steps necessary for the creation of such a machine were dis- sed recently at a nationwide Soviet conference on problems of chine linguistics, attended by Russia's outstanding specialists in tronics, mathematics and languages. Present also were a few ntists from Red China and Czechoslovakia who read reports on chine linguistics in their countries. In giving details of this con- nce, L. Voronkova in the Moscow *Trud* makes it clear that ingrad was chosen as the site of the conference because that is fast becoming the Red empire's foremost center of such erimentation. She claims that the world's first subdivision of thematical linguistics and experimental laboratory of machine nslation were established at the Philology Department of the Uni- sity of Leningrad.

The laboratory is now working to evolve 17 systems which the ssians define as "alogorhythms," and among which the Soviet ntists have already included the Indonesian, Burmese, Arabic l other Oriental languages. The inclusion of these and other tern tongues for machine translation and "information machine" erimentation shows Moscow's conviction that the time is not far when scientists of the Orient will increasingly contribute to the rld's storehouse of modern knowledge.

west coast industry

by Fred S. Hunter

In this initial-conscious age, Lockheed hopes its selection of name for the new Lockheed Electronics and Avionics Divis (LEAD) turns out to be prophetic. It may well be.

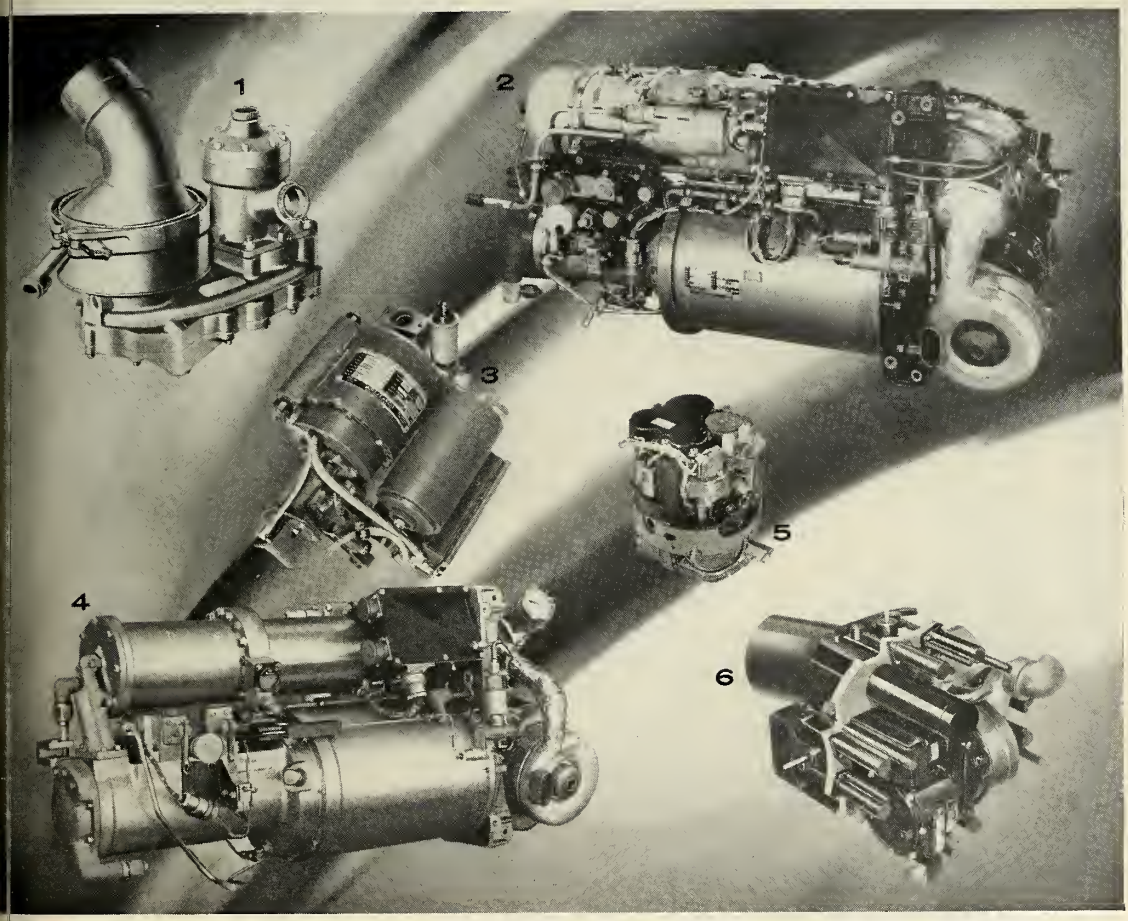
At the annual meeting of shareholders, Chairman Robert E. Gr said Lockheed was starting the new electronics enterprise with modest capital outlay. It is spending approximately $400,000 in furbishing the former Constellation subassembly plant in southe Los Angeles for a headquarters and manufacturing facility. Lockhe already owned the property.

Gross also said the division will grow "slowly and soundly." this writing, the payroll numbers 27 persons. The employment p jection is for 450 by the end of this year.

In its first year, Lockheed's Missile Systems Division had sa of $7.2 million, but, barring a windfall, LEAD's first-year revent will be substantially less. In 1954, the new missile division, th located wholly at Van Nuys, was given a head start by the trans of the *X-7* test vehicle program from the California division. LEA is starting from scratch, with no diversions from other divisions, a its primary objective right now is to establish its capabilities.

Initially, Lockheed is preparing 163,000 square feet of a to plant area of approximately 380,000 square feet for occupancy the new electronics division. New walls have been installed to sl off engineering, manufacturing, shipping and receiving and oth areas. "They're moveable—we can expand in any direction," s Russell C. Galbraith, the former director of financial operatic for the California division, who came over to fill the No. 2 execut post as assistant general manager of LEAD.

The plant—first occupied temporarily during World War II the production of P-38 assemblies and then, after a lapse of 10 yea purchased in 1955 to expedite Super Constellation subassembly wo —is to be a permanent manufacturing facility for LEAD. H quarters here for the general office and engineering staffs will temporary. Lockheed has its eye on a site in the Newport Bea area, where it plans a new facility specially designed to house t administrative and engineering staffs.



Lockheed is in the hardware business in all its divisions a LEAD will be no exception. This means it will be striving for co petence in the production of systems. Its first efforts will be in strumentation and subsystems useful principally for military systen but it will also investigate the possibilities of entering industrial a commercial markets. "We have no aspirations in the consumer fiel said Stephen J. Jatras, acting director of marketing.

Lockheed has started on the job of staffing the new divisi across the board—engineering, manufacturing, administrative. "W must have men who stand at the top of their fields," said K. Kiddoo, who worked on personnel procurement for Lockheed wh it established its missile division and is now doing the same thi for the new electronics division.

Some of the key jobs will be filled by people drawn from oth divisions of the company, but others will come from outside. "It w depend upon where we find the capabilities we require," said Howa S. Hagen, director of industrial relations.

By June 15, Lockheed expects to have procured a number of t people it needs. By the same time, it will be ready to start movi in some of its machines. It will then be in a position to step to the production development stage.

DELIVERED—thousands of missile APUs

olid propellant—hydraulic output **2.** *Liquid propellant—hydraulic and electric output* **3.** *Solid propellant—electric and mechanical drive output*
4. *Liquid propellant—hydraulic and electric output* **5.** *Solid propellant—hydraulic and electric output*
6. *Solid propellant—hydraulic, electric and steering outputs*

Research has designed, developed, nufactured and delivered thousands o missile accessory power units. Ex- mely reliable and lightweight, these rious solid and liquid monopropel- t APUs are completely self-sustain- within the missile system. Designed minimum space and weight require- nts, they are built to withstand high loading and severe temperature e remes.

The several units pictured above provide hydraulic, electrical and/or steering surface control depending on the customer's requirement. Delivered horsepower ranges from 1.2 to 35 h.p. over hot gas operating durations from 30 seconds to 20 minutes. Electrical regulation is maintained as closely as ±½%. A significant advance in missile APUs is unit #6 pictured above. This package represents the first integrated hydraulic and electrical power unit providing a steering surface actuation system.

These tailored systems utilize the extensive hardware experience and complete laboratory, test and production facilities of AiResearch needed for quick and efficient quantity production of complex APU systems. AiResearch is the world's largest and most experienced manufacturer of lightweight turbomachinery—the key component of its APU systems. Your inquiries are invited.

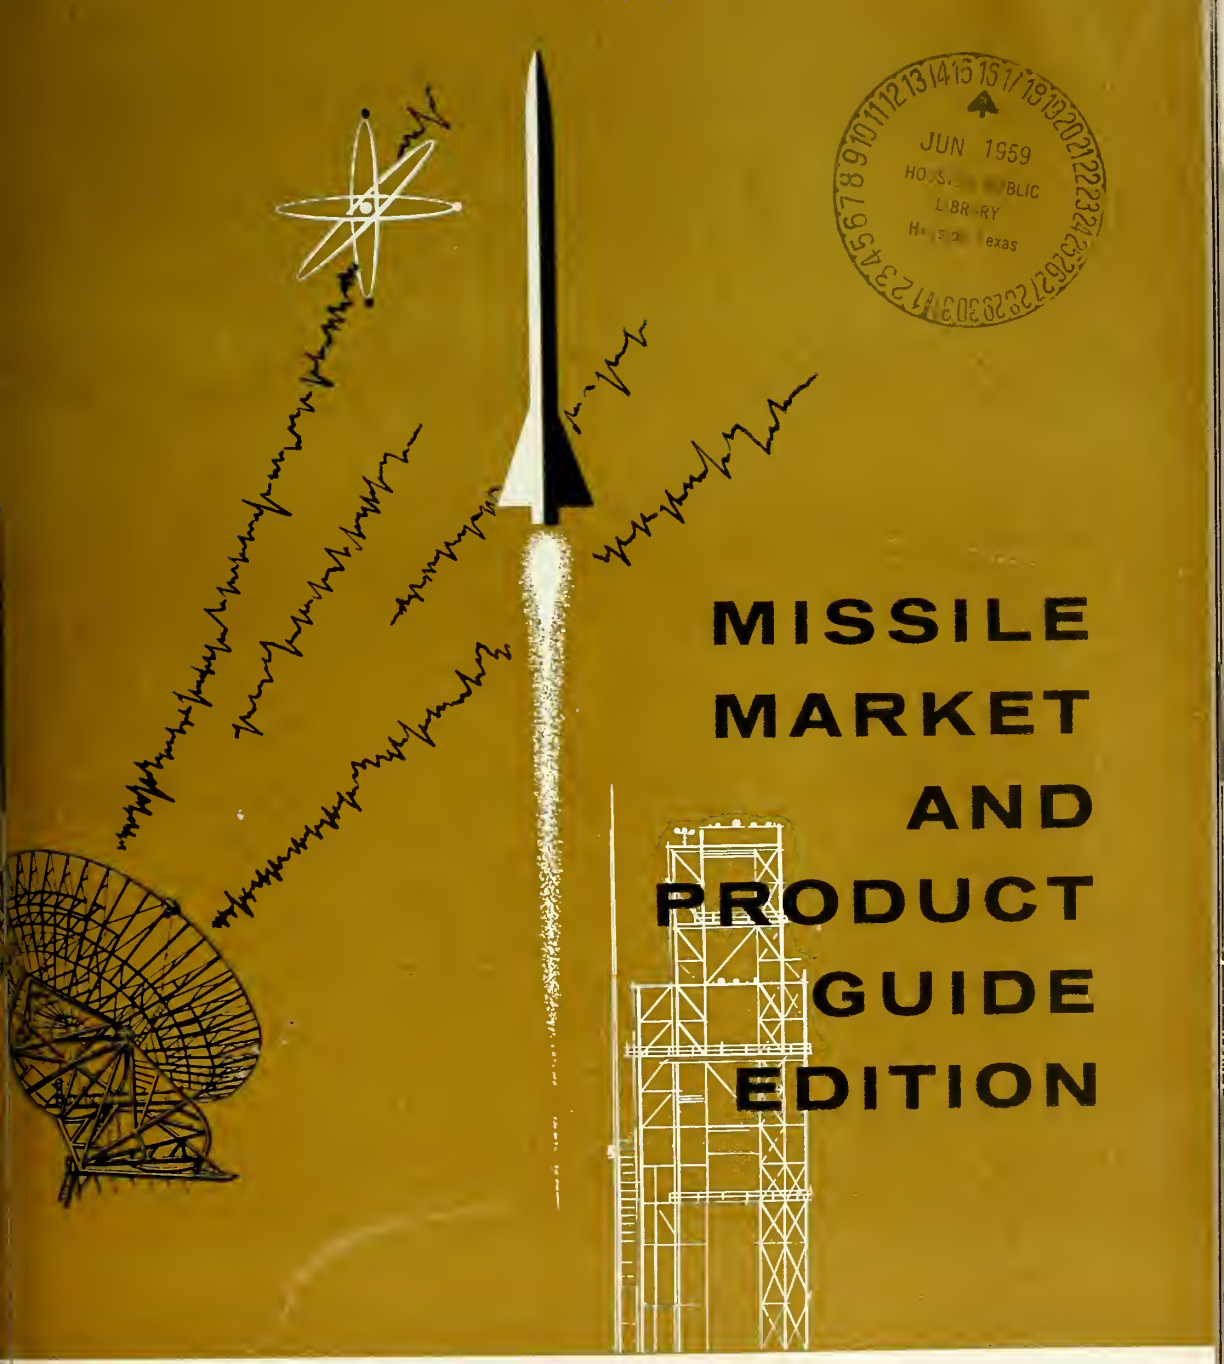
New Spectral Density Equalizer/Analyzer System

...for continuous and parallel observation and control of test spectrum in vibration and acoustic testing programs

Announcing another Ling first—the new Spectral Density Equalizer/Analyzer System! This new system allows *continuous, parallel* observation and control of the entire spectrum of energy distribution during random wave vibration or high-intensity sound testing.

The Ling ESD-20/ASD-20 System reduces peak and notch filter set-ups...eliminates tedious adjustments for system response uniformity...makes continuous, accurate equalization possible at any vibration level.



In the Ling Spectral Density System, the random source output is divided into 26 frequency bands—each independently controlled by a simple vertical attenuator. Outputs from all 26 bands are rapidly and sequentially sampled and displayed on a cathode ray oscilloscope to provide the operator with a continuous view of the spectrum during the test. This new equalization system may be added to existing random wave vibration test systems...or incorporated in any new Ling random wave system. Available *only* from Ling Electronics.

5 Major advantages of new Ling ESD-20/ASD-20 Syst

1 **FASTER**—Reduces set-up time to a few
2 **MORE ACCURATE**—Permits continuous, observation and control of entire spect Load shifts during test can be detected corrected immediately.
3 **BETTER EQUALIZATION**—Compensates a non-linearities in specimen or system co
4 **EASIER TO OPERATE**—Operator has cont picture of shaker vibration spectrum on o ...makes corrections with simple level adjustments of filter attenuators.
5 **BETTER SPECIMEN PROTECTION**—New L system prevents over stress of specime set-up stages.

for exacting engineers . . .

RHEEM PRESSURE VESSELS

When the "go no-go" signal depends upon a complexity of parts and pieces supplied by scores of subcontractors, a missile systems engineer with prime contractor responsibility must have confidence that the multitude of components will stand up to the principles of his design. In the design of modern high-performance aircraft and missiles, often the heart of the propulsion system (or of a major auxiliary system) is a pressure vessel.

Whether specifications call for titanium or stainless steel spheres, or more specialized configurations of even newer metals and alloys, it is the ultimate reliability of the hardware that will prove or disprove the system design. That is why exacting engineers specify pressure vessels by Rheem. That is why over the past seven years companies like Convair, North American Aviation, and Lockheed Aircraft Corporation have ordered more than 26,000 Rheem pressure vessels for applications in the major aircraft and space projects of the nation.

When an experienced hand in critical welding and machining operations is needed for the production of vessels that can be relied upon, consult the leader in pressure vessels. Consult Rheem early. Let Rheem engineers assist you in the development, as well as in the production, of vessels and containers to meet your specialized needs. Write to Dept. MR-717-1.

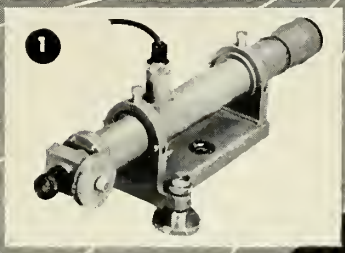
SOME DOWN-TO-EARTH THOUGHTS ABOUT THE SPACE AGE

Like all those who participate in the progress of aviation, we are awed by the prospect of the conquest of space. But before we rush headlong into the cosmic dust, let's hang up our space helmets for a moment for some sober reflection on what it will take to get there.

In the race toward tomorrow, look to the reliable as well as the swift. Our recent missile successes and "failures" clearly indicate that space conquest will depend not only on technological *breakthroughs*, but equally on the virtual elimination of mechanical *breakdowns*. Good hardware is even more important in the space age.

For over 16 years, Hydro-Aire has built a reputation on building better hardware for airborne vehicles. Today these products function reliably on virtually every type of aircraft. The same ingenuity and dependability that made these products possible is now the key to solving the problems of more hostile environments, more stringent operating conditions.

The men whose space vehicles will be equipped with these products, can don *their* space helmets with confidence.



Challenging positions are now open for qualified design engineers on Hydro-Aire's expanding staff. Submit inquiries to Mr. D. B. Nickerson, Chief Engineer, Hydro-Aire, 3000 Winona Avenue, Burbank, Calif.

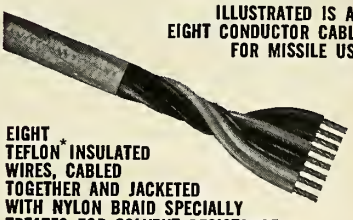
missiles and rockets Vol. 5, Number 23

Published annually by American Aviation Publications, Inc., 1001 Vermont Ave., N.W., Washington 5, D.C. WAYNE W. PARRISH, President & Publisher; LEONARD A. EISERER, Executive President & General Manager; A. H. STACKPOLE, Vice President; FRED HUNTER, Vice President; ERIC BRAMLEY, Vice President; ROBERT R. PARRISH, Vice President. Printed at the Telegraph Press, Harrisburg, Pa. Second class postage paid at Washington, D.C., and at additional mailing offices. Copyright 1959, American Aviation Publications, Inc.

Subscription rates; U.S. and Canada—1 year, $8.00; 2 years, $12.00; 3 years, $14.00. Foreign—1 year, $9.00; 2 years, $14.00; 3 years, $17.00. Single copy rate—$.75. (This issue $5.00). Subscriptions are solicited only from persons with identifiable commercial or professional interests in missiles and rockets. Second class mail privileges authorized at Washington, D.C., with additional entry at Harrisburg. Copyright 1958, American Aviation Publications, Inc.



WIRE PRODUCTS

CUSTOM CONSTRUCTED CONTROL CABLES and THERMOCOUPLE- WIRE CABLES

with segregated circuits individually shielded, and with over-all shielding or with special shielding and jacketing.

ILLUSTRATED IS AN EIGHT CONDUCTOR CABLE FOR MISSILE USE.

EIGHT TEFLON* INSULATED WIRES, CABLED TOGETHER AND JACKETED WITH NYLON BRAID SPECIALLY TREATED FOR SOLVENT RESISTANCE.

FIRE-RESISTANT and HIGH TEMPERATURE RESISTANT CABLE

for circuits required to operate in 2000° F. flame for fifteen minutes. Excellent for fire-detector circuits and for use in temperatures up to 600°F.

HIGH TEMPERATURE CABLE...

Suitable for operating temperatures up to 650° F. with nickel-clad copper conductor and laminated insulation having superior dielectric strength and moisture resistance. In AWG sizes 22 thru 4/0. In accordance with MIL-C-25038.

ELECTRONIC HOOKUP WIRE...

Teflon insulated silver coated copper conductor with insulation in standard colors in accordance with MIL-C-16878.

EXTRA FLEXIBLE CABLE . . .

High Temperature and Moisture Resistant Electrical Cable. Lewis "EXFLEX" Cable, single and multi-conductor, superior for circuits on hinged or pivoted parts. Resistant to abrasion and temperatures to 500° F.

* TEFLON is a Du Pont product

BASIC BUILDING BLOCKS

SERVO SYSTEM COMPONENTS

- Servo Motors—Frame Sizes 5-25
- Synchros and Resolvers—Frame Sizes 5-25
- Tachometers—Damping, Rate, Integrating
- Transistorized Amplifiers —High Temperature 2.5-16 watts

Synchros—Size 25—20 sec. max. error

HYDRAULICS

6100 Series Servo Valve

Servo Valves

- Two moving parts
- Anti-clogging — over size orifices, high pressure clearing
- Flow rates—0-5, 0-10 gpm

Systems

For hi-performance hydraulic or pneumatic missile control.

COMPUTERS

- Great Circle Course and Navigational
- Inertial Position
- Guidance
- Analog and Digital for Missile Applications

Navigational Computer

INERTIAL GUIDANCE

25 lb. Inertial Platform

Components include floated gyros, single and two-axis accelerometers, first and second integrators, computers. Complete systems in production for major missile applications feature high accuracy, long-term reliability, light-weight construction.

GYROS

- Rate-floated Integrating; Spring Restrained
- Vertical—Miniature, Self-Contained
- Two Axis Free For Missile Control
- Directional, Conventional and Roll Stabilized
- 3 Gyro, 3 and 4 Gimbal Platforms
- North Seeking Theodolites

Miniature Floated Gyro

GROUND SUPPORT

Completely integrated ground support equipment based on unique Kearfott test equipment modules for analog or digital, manual, semi-automatic or fully automatic testing of components, sub-systems or systems.

Digital Logging System

MICROWAVE

- Waveguides, Strip Transmission Lines, Ferrite Components
- Radar rf and Antenna Assemblies
- Transponder Systems, Target Simulators, Test Sets
- Traveling Wave Assemblies

Antenna Array

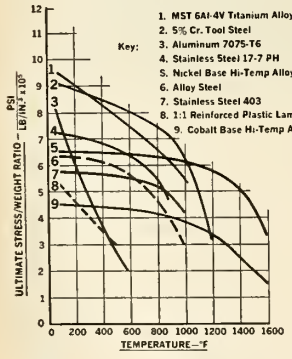
Another important advance in **TITANIUM**



Sub-scale rocket motor hydrotest case, 20-inch diameter, fabricated from Mallory-Sharon 6Al-4V titanium alloy by the Tapco Group of Thompson Ramo Wooldridge.

TITANIUM ROCKET MOTOR CASE

with guaranteed tensile strength/weight ratio of 960,000

VARIATION OF ULTIMATE STRENGTH/WEIGHT RATIO WITH TEMPERATURE (of comparable ductilities)

Test Data Courtesy of Thompson Ramo Wooldridge

New, advanced type, solid-fuel propellants . . . plus the need to achieve maximum range . . . demand a new look at tensile strength/weight ratios in rocket motor cases. Today's goal: hold rocket-case weight to *less than 10%* of propellant weight.

To achieve this goal, tensile strength/weight ratios of close to 1,000,000 are required in the rocket case. In this range, welded heat-treated steels develop severe embrittlement and high notch sensitivity when subjected to rocket case hoop stresses — largely ruling out their use. Titanium overcomes these disadvantages, plus giving *a weight saving of 25% to 38% over the best competitive steels!*

The Tapco Group of Thompson Ramo Wooldridge has carried out extensive development and testing, proving Mallory-Sharon 6Al-4V titanium alloy to be the most suitable material for this application.

It provides the necessary strength and ductility without embrittlement or distortion . . . can be readily welded and age hardened to give the welded strength/weight levels required.

For technical information on MST 6Al-4V or other titanium alloys, write to: Aircraft & Missile Development Dept., Mallory-Sharon Metals Corporation, Niles, Ohio.

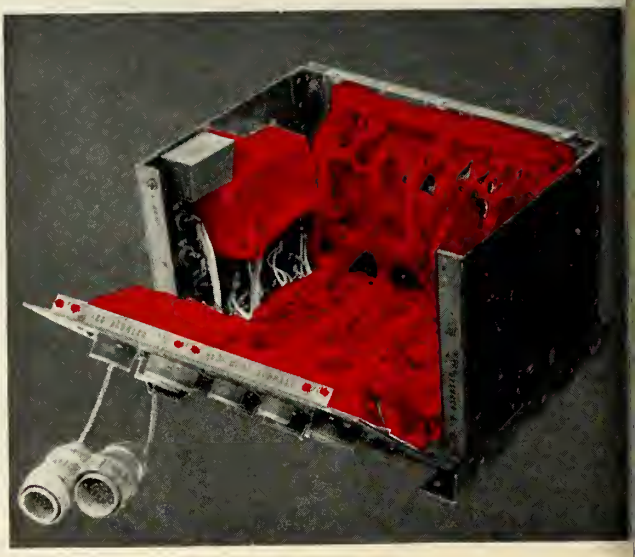
index to advertisers 322

(Note: Throughout the issue, advertisers are identified by boldface listings.)

The MISSILE:

U. S. A. F. Northrop's SM-62 Snark, with a range of more than 6000 miles. Now operational, the Snark is America's first intercontinental guided missile. Powerplant is a Pratt & Whitney J-57 turbojet. Guidance is by a stellar-monitored inertial system.

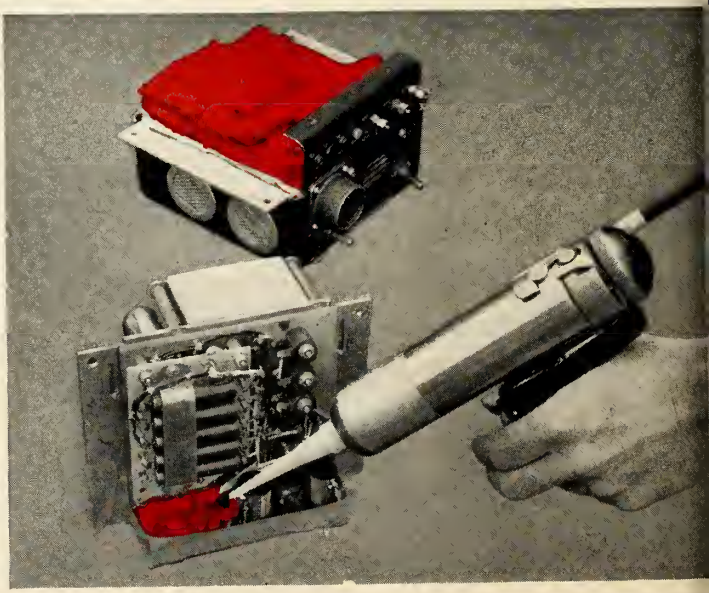


The MATERIAL:

SILASTIC
SILICONE RUBBER

In the Snark, panels containing resistors, capacitors, transistors and other electronic components are cushioned by Silastic*, the Dow Corning silicone rubber. Silastic protects against moisture, vibration damage, electrical leakage.

*T.M. REG. U.S. PAT. OFF.



The METHOD:

Encapsulating with Silastic RTV, via calking gun. Silastic RTV vulcanizes completely at room temperature. When vulcanized, it has the characteristics typical of Silastic: resistance to extreme temperatures, moisture, ozone, corona. Electrical properties are excellent. Silastic RTV can be slit open for repair work and then re-sealed. Write for sample and technical data.

Missile Support—a New U.S. Industry

Within the months ahead this country will see the development of an almost new segment of industry—one which will eventually run into billions of dollars. It is the construction of ballistic missile bases and the equipping of them with supporting hardware.

Involved to some extent will be the same companies which produce the missiles, the big primes which have traditionally been associated with the spacecraft and/or the aircraft business. But in addition to them, thousands of big and little companies to whom the missile and space industry a few months ago was as foreign, say, as a trip to Mars, will find themselves accidentally or intentionally concerned with producing or installing the thousand and one items which go to support the missiles of the very new future.

For the missile—and while this is intended primarily to treat of the big intercontinental ballistic types it also holds true for the smaller ballistic weapons and the air-breathers as well—is somewhat like the iceberg where cost visibility is concerned. Something like four-fifths is hidden. For example, a *Titan* ICBM may cost $2 million. The site to contain a squadron of nine *Titans* will cost $45 million, not including the personnel to man it.

The $45 million takes in the cost of a concrete blockhouse strong enough to withstand an accidental explosion; the cost of communications cables connecting with each launching pad—many-stranded cables which will snake through conduits at the cost of $800 a foot. It will include tons of concrete for handstand, miles of pipe for both liquids and gases; scores of pumps, hundreds of valves, generators, tubes and transistors, tons of steel in every form, aluminum and a dozen other metals, scores of chemicals. Heavy earth-moving equipment will be used, trucks, bulldozers, forklifts, lumber, lighting equipment—gauges and computers and every form of checkout equipment.

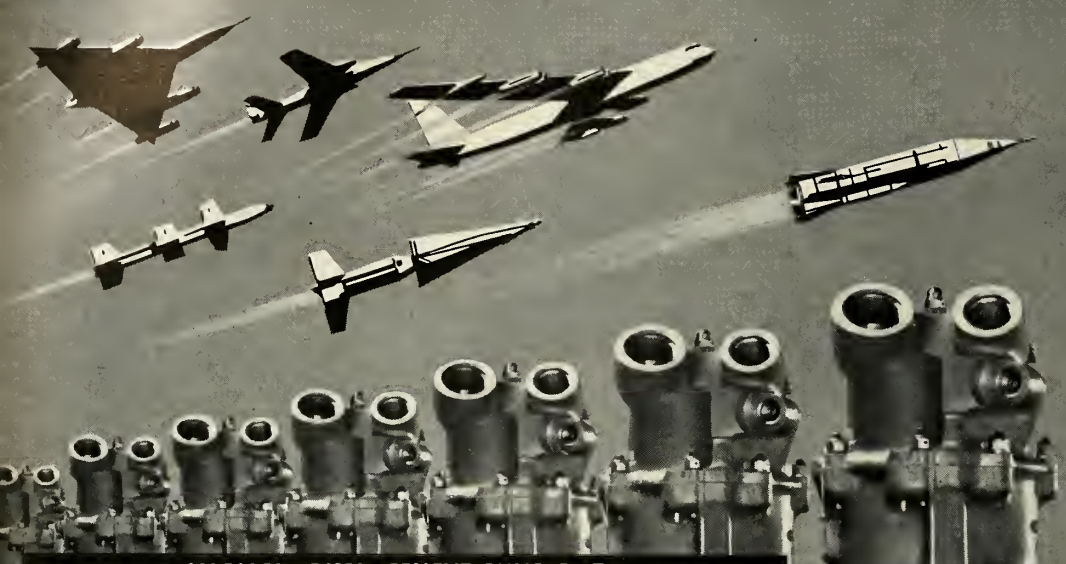
Some of the big ballistic missile launching pads will be hardened, that is, either sunk in holes or otherwise protected from possible enemy nuclear weapons. Our first ICBM, the *Atlas*, will be partially hardened, at some sites at least, probably to lie in a rough concrete-lined coffin with a sliding cover. From this "coffin" it will be raised and fired. The second liquid fuel ICBM, the *Titan*, will be lowered into holes in the ground, inverted silos, from which they will be raised to the surface and fired. The third ICBM, the second-generation, solid-fuel *Minuteman*, will also be housed in inverted silos from which it will be fired without elevating to the surface. A solid-fuel vehicle can be fired from the hole because it rises much more quickly in the initial firing stage and thus does not present the heat dissipation problem of the liquid-fuel missile.

The ICBM sites must also include living quarters for personnel, storage facilities for materials and for maintenance equipment. They must include, believe it or not, recreation facilities for crews who will be on constant alert 24 hours of every day.

None of the equipment needed for a missile site—and none of the skill—is new to American industry (with the exception of some of the more esoteric checkout and testing devices), but industry will be faced with a demand from the military services to come up with new techniques for both speed and lower costs.

How do you drill a hole 100 feet deep and 20 feet in diameter for the *Minuteman?* How do you line it with concrete, properly reinforced to withstand the shock of a near-miss nuclear explosion?

The services say: "Give us a new technique which will dig the holes in one day and line them with concrete in another—all at a cost of $50,000 and not $500,000." And they are talking about as many as a thousand holes for a thousand *Minutemen.*



Which will be the companies to come up with new ideas in prefabrication, in miniaturization? Who will provide the shortcuts, the better, the faster and the cheaper way to do it?

There is no royal road to defense contracts and no magic formula for bidding. Uncle Sam is a tough customer and he wants and usually gets a full dollar's worth for every dollar he spends. He is as eager to find the little company with the bright idea or the special skill as he is to deal with the giant primes. Equally true is the fact that the big companies are always searching for the little man who has found a better way to do it. The price of missiles will come down as the skills of spacecraft advance—$100,000 for the *Minuteman,* for example. In parallel fashion, the cost of missile sites must lower, too, and it will be industry, big or little, which will bring that cost down through ingenuity while reaping a golden harvest as it happens.

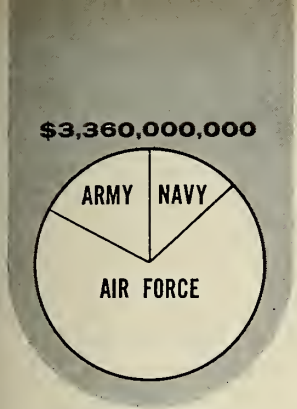
A NEW FAMILY OF BENDIX CONSTANT AND VARIABLE DISPLACEMENT HYDRAULIC PUMPS

SMALLER • LIGHTER • FEWER PARTS • SYMMETRICAL ENVELOPE • COMPACT • RUGGED DESIGN

INHERENT HIGH SPEED CAPABILITIES • SUPERIOR CONTAMINATION TOLERANCE • HIGH RELIABILITY

The rugged, simplified construction of Bendix® hydraulic pumps plus precision production and quality control experience provide pumps with increased reliability for missile and aircraft systems. Smaller envelopes permit interchangeability with existing installations and compact packaging for new applications. Thousands of hours of endurance, qualification and flight testing have proven the Bendix family of hydraulic pumps will exceed all existing customer and military requirements.

Pumps are furnished as separate components or as an integral part of complete sub-systems. Standard pumps are furnished with forged aluminum housings for temperatures up to 400°F. and pressures up to 4,000 psi. Previous qualifi cation of pumps for 550°F. assures you of high reliability fo lower temperatures and availability of proven pumps fo high temperature systems.



Advanced engineering, laboratory, precision manufac turing and complete service facilities are available fo producing and servicing Bendix hydraulic pumps. Thi assures you of a quality pump manufactured specifically fo your application.

All pumps are assembled and tested in a new air conditioned, humidity-controlled, dust-free area assurin contaminate-free pumps as delivered.

MAJOR PRODUCTS—aircraft and missile hydraulic pumps; hydraulic components and sub-systems; engine fuel pumps and fuel system components; precision bellows and bellows assemblies; thermostats and related sub-assemblies; and sub-contract manufacturing and brazing.

Procurement & Production
Missiles, FY 1960

How To Do Business With the Defense Department

Outlined here are some helpful pointers for the average business man who wants to sell to the Department of Defense but doesn't know quite where to start . . .

TO THE AVERAGE business man hunting a contract from the Defense Department, the questions of whom to see, where to go and what to take with him are almost insoluble. Difficulties stem not only from the complexity of the Defense Department's procurement organization but also from changes which are almost constantly made in the techniques and rules of procurement.

As a starting point, the Defense Department, itself, buys nothing. It has a number of procurement agencies. The biggest, of course, are the Army, Navy and Air Force, with the Defense Department's Advanced Research Projects Agency likely to enter the field later. Each of these agencies themselves are subdivided with procurement responsibility decentralized throughout the country.

DOD's basic role in procurement is one of policymaking. It also decides how many dollars each of the services may spend and, in some cases, actually decides which weapon system may be bought and by whom.

Purchases are made either by formal advertising or by negotiation. For missiles, rockets, ground support equipment, and subsystems, normally a procedure called "competitive negotiation" is used. This means, generally, that contractors thought to be qualified are invited to submit competitive proposals which are evaluated. After evaluation, a contract is negotiated with the contractor whose proposal seems most nearly to meet the military requirement.

Rules governing both formal advertising and competitive negotiation are spelled out in great detail in the Armed Services Procurement Regulation, Army Procurement Procedure, Navy Procurement Directives and, Air Force Procurement Regulations and Instructions.

Most big manufacturers who do business with the agencies of the Defense Department on a regular basis maintain Washington organizations to handle the technical problems inherent in the complex procurement structure. It is the company which wants to come in for the first time or the small business firm which needs the most guidance.

All kinds of advice is available, particularly to small business concerns. To qualify, a concern must have less than 500 employees and cannot be dominant in its field of operation. A certificate from the Small Business Administration will be taken at face value by Defense Department procurement officers.

Each of the military departments has an active program to help small business to compete for defense procurement. In addition, some contracts may be set aside in whole or in part for the exclusive benefit of small business.

In the case of equal low bids submitted by a large and a small company, preference would generally be given to the small concern. However, if a big company agrees to perform the work in an area of substantial unemployment, it will receive a preference over a small concern which won't or can't produce in a labor surplus area. To bolster the small business program, Defense officials work with the Small Business Administration to screen procurement that can be set-aside for exclusive small business participation. However, there is more than a little question as to the effectiveness of the program.

Generally, Defense officials have expressed the belief that the most effective role which small business can play is in the subcontract structure. All major contractors maintain an active program which aims at establishing a qualified list or lists of subcontractors and suppliers. Many defense contracts specifically require that a specified percentage of a big contract be subcontracted and gradually, the military services are screening the subcontract structure to be sure that conditions are complied with.

For subcontracts, manufacturers are advised to apply directly to prime contractors. Names of the principal contractors can be obtained from a Commerce Department Synopsis of Bids published almost daily and from records maintained by the Defense Department.

In the research and development area, special opportunities are available to small concerns and nonprofit institutions. Here the yardstick is competence, which frequently has little to do with size. Special efforts are made both by the military departments and the Defense Department to find the right man or the right company for the job in the area of research and development. More details will be found in other articles in this section.

In general, a would-be contractor will find the following rules helpful:

(1) Don't come to Washington when you first decide you want military work.

(2) Analyze the capabilities of your company, including facilities know-how, available labor pool, management and finance.

(3) Visit the nearest procurement or contract administration office to your plant, taking with you your analysis of company capabilities.

(4) Visit prime contractors, taking an analysis or proposal with you, picking those prime contractors who are located close to your own plant.

(5) Study or have a competent lawyer study the procurement structure of the military departments to be sure that buying representatives are made aware of your company's capabilities.

(6) Don't sign a contract without competent advice.

PROCUREMENT & PRODUCTION
MISSILES, FY 1960

How To Do Business With the Air Force

The buying arm of the Air Force carries over one million items in inventory. Here is a rundown on where the would-be contractor should go and what he should do when seeking this business . . .

AIR MATERIEL COMMAND located at Dayton, Ohio, is the Air Force's buying, supply and maintenance arm. Its workload is decentralized to Air Materiel Areas, Centers and Depots. It buys new production weapons for inventory, provides spare parts and material to maintain equipment already in the hands of the troops and makes research and development contracts on orders from the Air Research and Development Command. Some idea of the scope of the job can be obtained from the fact that AMC carries more than 1,300,000 items in inventory.

Knowing that a requirement will exist for better tooling, a new material, or new electronic equipment, it makes manufacturing methods contracts with research organizations and with industry in an effort to assure the availability of equipment in production quantities and at practicable costs.

Air Materiel Command is headed by Lt. Gen. Samuel E. Anderson, Jr. His deputy is Lt. Gen. William F. McKee. It is divided into six directorates which now operate as staff offices. These are: Plans and Programs, Procurement and Production, Supply, Maintenance Engineering, Transportation and Services, and Personnel and Support Operations. There is a separate Quality Control office to improve reliability.

Major responsibility for procurement is vested in the Aeronautical Systems Center at Wright Patterson Air Force Base, Ohio, and the Ballistic Missiles Center, AF Unit Post Office, Los Angeles 45, Calif.

Aeronautical Systems Center is responsible for the purchase of complete missiles, other than ballistic, complete aircraft and aerial targets. In addition, it is responsible for the procurement of fire control systems, launchers, rocket and pyrotechnic weapons, warheads and explosives, photographic equipment, bombing and gunnery equipment, airborne radio and radar equipment, initial spares and ground support and tools/test equipment except for propulsion systems, research and development and service test of non-stock listed items. It buys, of course, many kinds of aircraft accessories and equipment.

Ballistic Missiles Center buys ballistic missiles, space vehicles and related equipment such as propulsion and guidance systems, ground support equipment, initial spares, tools, test equipment and the like. In the space field, Ballistic Missiles Center lets contracts on instructions from Advanced Research Projects Agency as well as the Air Force.

Electronic Defense Systems Division, 220 Church Street, New York City is responsible for the procurement of engineering management and other services for Air Defense Systems such as SAGE, DEW Line/White Alice (Alaska) and the new Ballistic Missile Early Warning Line.

The Air Materiel Areas have been designated Logistic Support Managers as well as weapon system managers to be sure positive supply support is provided to tactical units of first line weapons. This means:

Middletown Air Materiel Area, at Olmsted Air Force Base, Middletown, Pa. buys guided missile components support and rocket engine parts for the *Falcon* (GAR 1,2,3, and 4); *Sidewinder* (GAR 8); fuels, lubricants oils, waxes and corrosion preventative compounds; chemicals and chemical products; gases, compressed and liquified and gas cylinders; miscellaneous instruments (other than Government-Furnished Aircraft Equipment—GFAE) and laboratory equipment; electrical meters and maintenance parts; parachutes and aerial pickup and cargo tie-down equipment. It also provides for contractual maintenance and modification services for the support of commodities listed above and missiles and/or engines for which it has prime maintenance responsibility. It also buys structural components and aircraft engine parts for specified training, transport and liaison aircraft.

Mobile Air Materiel Area, Brookley AFB, Mobile, Ala., buys guided missile components for the SA-16 *Jupiter* intermediate range ballistic missile and aircraft components for the F-84 and F-105. It also provides for contractual maintenance and modification services for this missile.

Ogden Air Materiel Area, at Hill AFB, Ogden, Utah buys guided missile components, support and engine parts for the IM 99 *Bomarc*, SM-62 *Snark* and the SM-73 *Goose* (now cancelled). It also buys laboratory equipment biological surveillance and provides contractual maintenance and modification services for the listed missiles and/or engines. It also keeps parts for F-101 and other specified aircraft.

Oklahoma City Air Materiel Area, Tinker AFB, Oklahoma City, buys guided missile components, and support for the *Rascal* (GAM-63, now cancelled); *Hound Dog* (GAM-77) and *BullPup*, and provides maintenance and modification services for these missiles. It also buys parts and support for B-52, B-47, KC-135 and other aircraft.

Rome Air Materiel Area, Griffiss AFB, Rome, N.Y. is responsible for the purchase of the largest part of the Air Force's electronic, radio and radar

equipment procurement. Specifically, it buys ground radio, radar and navigational equipment, meteorological equipment, instruments (except airborne) and supplies; ground communications equipment, miscellaneous electric power and distribution equipment and supplies, lighting fixtures for airports, lighting fixtures and lamps (except airborne), and electric wire and cable.

Rome AMA buys the engineering and installation of ground electronics support equipment, facilities and systems (GEEIA). It also buys systems integration, development, service test and similar functions required for implementation and operation of Electronic Support Systems (ESSPOs).

San Bernardino Air Materiel Area, at Norton AFB, Calif., has been designated the support manager for ballistic missiles. As such, it buys guided missile components and support for the *Atlas, Titan* and *Thor* ballistic missiles and will, presumably, take on the job for *Minuteman* at a later date. It is also responsible for the support of the Q-2 target drone built by Ryan and the Q-4 drone built by Radioplane. It also buys parts and support for specified aircraft.

Warner Robins Air Materiel Area, Robins AFB, Macon, Ga., buys guided missile component support for the *Matador* (TM-61) and *Mace* (TM-76) and airframe structural components for the C-130 and B-57. Aircraft launching, landing and ground handling equipment; weapons, except Army Ordnance assigned items; bearings; metal working and woodworking machinery and equipment; maintenance and repair shop equipment (aircraft, motor vehicle and weapons); tires and tubes, except aircraft; gas turbines and jet engines, except aircraft; rescue and safety equipment. The AMA will provide contractual maintenance and modification services for support of commodities listed above and aircraft, bombing, gunnery and fire control systems and equipment and aircraft and missiles and/or engines for which the AMA has primary responsibilities.

Dayton AF Depot, Gentile AF Station, Dayton, Ohio, buys airborne radio, radar and navigational equipment and components, airborne communications equipment; electrical and electronic equipment, components; terminals; terminal boards, connectors, fuses, lightning arrestors, capacitors, resistors, switches, circuit breakers, tubes, relays, contactors, solenoids, insulators, knobs, pointers, dials and piezo electric crystals, laboratory and shop test inspection equipment and maintenance parts, measuring tools, inspection gages, and combination and miscellaneous instruments. Dayton does *not* buy any Government Furnished Aircraft Equipment (GFAE) in the way of airborne radio or airborne communications equipment.

There are two other air materiel areas and one depot. **Sacremento AMA** at McClellan AFB specializes in the purchase of airframe structural parts for aircraft including the F-100, F-104 and the upcoming F-108 among others. **San Antonio Air Materiel Area,** at Kelly AFB, Tex., buys airframe structural parts and engine parts for the B-58, the F-102 and has been designated the support manager for the B-70, chemical bomber and the WS-125A, nuclear-powered aircraft.

In outlining the decentralized procurement responsibility, Air Materiel Command notes that there is, in addition, a local purchase or base procurement program. This deals with the purchases of supplies and services required to support a specified installation. Most of the items bought are of a housekeeping nature.

Actually the would-be contractor or subcontractor doesn't have to go to the listed AMAs for help. Middletown AMA is responsible for five procurement districts, located at Boston, Newark, New York, Philadelphia and Rochester. In addition, there are eight Air Procurement offices, located at Hartford, Conn., Hackensack, N.J., and South Orange, N.J.; Stamford, Conn.; two in Pittsburgh, Pa., and one at Buffalo and Syracuse, N.Y. Finally AF has stationed at the plants of principal contractors representatives who can help. These are located at Bell Aircraft, Niagara Falls; Curtiss-Wright Wood-Ridge, N.J.; Fairchild Engine and Airplane at Hagerstown, Md., General Electric, Syracuse; Sperry Gyroscope, at Great Neck, L.I. and United Aircraft at Stamford, Conn.

How does the Air Force manage its vast buying program? It uses what it calls the Weapon System Integration concept. This means that an AF contract gives a strong prime contractor the basic responsibility to design, develop, produce and manage the total effort under the supervision of the Air Force.

However, this does not mean that subcontractors and suppliers are left out in the cold. AF usually requires that a specific part of the contract be subcontracted. It also wants to approve the subcontract structure.

Purpose is to be sure that the prime contractor does not keep in-house work which can be done more efficiently or economically on the outside.

Most of the prime contractors maintain active organizations which aim at building up and maintaining a strong subcontract structure. These involve in some cases as many as 23,000 subcontractors and suppliers, with 5,000-6,000 not being in any way unusual. A good point of contact for business is the prime contractors including: Boeing Airplane Co., Seattle, Wash.; North American Aviation, Canoga Park and Downey, Calif.; Lockheed Aircraft, Sunnyvale, Calif.; Aerojet General Corp., Nimbus, Calif.; Convair Division of General Dynamics at San Diego, Calif.; McDonnell Aircraft, St. Louis; Radio Corporation of America, Camden, N.J.; General Electric, Philadelphia, Pa., and Syracuse, N.Y.; Douglas Aircraft, Santa Monica, Calif.; Republic Aircraft, Farmingdale, L.I.; The Martin Company, Denver, Col., and Orlando, Fla.; Hughes Aircraft, Culver City, Calif., and Tucson, Ariz.

In one important area, Air Force does not handle its own work. Construction of missile bases, while planned for by the Air Force is handled by the Corps of Army Engineers acting as agent for the Air Force. Most of the contracts for construction of bases, many of which involve the installation of equipment, are handled on open bids invited by the District Engineer in which the installation will be located.

If you aren't interested in producing hardware but have a new idea, or a new way of doing something important for the AF, the Air Research and Development Command at Andrews AFB, just outside of Washington, D.C., frequently will talk business to private research groups, industrial concerns, regardless of size, and to nonprofit organizations.

ARDC is headed by a lieutenant general. There is a vice commander and an assistant vice commander. The office is divided into five main sections: Resources; Air Defense Systems Integration; Research; Ballistic Missiles, and Weapon Systems. Air Defense Systems Integration is located at Bedford, Mass. and the Ballistic Missiles Division is located at Inglewood, Calif. The other divisions are at Andrews AFB.

The resources office would probably be the first point of contact for a would-be contractor. It consists of: Directorate of Materiel; Directorate of Installations; Directorate of Procurement; Technical Services; Personnel; Operations; and Manpower and Organization. An Assistant Deputy Commander is charged with responsibility for contractual and technical services and would be helpful to the man with an idea.

The research engineering section would be another point of contact. It is the office which places most of the "pure" research contracts.

Procurement & Production, Missiles, FY 1960

How To Do Business With the Navy

Navy will spend over $6 billion in the next fiscal year. Here is a breakdown of those expenditures and tips to prime and subcontractors on how to obtain contracts . . .

FOR THE FISCAL YEAR 1959-60, the Navy plans procurement obligations totaling more than $6 billion. These contracts will involve everything the Navy needs from missiles, ships and planes to machined parts, food and clothing.

A breakdown of these planned expenditures shows the following major items:

Aircraft, $1.86 billion; ships, $1.7 billion; followed by various categories in the missile and rocket, and support systems areas—missiles, $716 million; electronics and communications, $318 million; construction, $266 million; miscellaneous procurement and production including target drones, machine tools etc., $96 million; production equipment and facilities, $26 million; and support vehicles, $30 million.

As with the Department of Defense and the other services, the two major approaches to selling to the Navy—whether it be hardware, supplies, equipment, missiles or support equipment, or research and development ability—are either as a prime contractor or as a subcontractor to a prime.

To obtain prime contracts, it is necessary to get on the bidders' lists for those items the company is qualified to produce. The Navy recommends reference to the booklet "How to Sell to Agencies Within the Department of Defense" which is available from the field offices of all the services. Major Navy field offices are the Inspectors of Naval Material located in 29 cities in all parts of the nation. The booklet covers both advertised and negotiated contracts.

If the interest is in the subcontract, it is necessary to get on the bidders' lists of the various primes. Lists of these primes also can be obtained from the Inspectors of Naval Material. The Navy recommends another booklet, "Selling to Navy Prime Contractors," NaVEXOS P-1030, as a source of information on procurement and production.

The third largest item in procurement obligations is for research and development work. Frequently such R&D contracts lead to production contracts.

These contracts usually are let by the interested bureau or office of the Navy on a competitive basis to the firm best qualified to do the work at the lowest cost. Detailed information may be found in two publications: "The Office of Naval Research Contract Research Program," which is available from the Chief of Naval Research, Department of the Navy, Washington 25, D.C.; and "Inventions Wanted by the Armed Forces," published by the National Inventors Council, Office of Technical Services, U.S. Department of Commerce, Washington 25, D.C.

Another good source of information, the Navy says, is the Department of Commerce's "Daily Synopsis of U.S. Government Proposed Procurement, Sales and Contract Awards" which is available for a yearly subscription of $7.00 from the Commerce Department's Field Service, Administration Service Office, 433 West Van Buren St., Chicago 7, Ill.

During the past five years, approximately 20% of the Navy's domestic procurement dollar went directly to small business, with another 20% to small business in subcontracts. The Navy has a vigorous program to encourage small business—some 130 persons are primarily concerned with helping small business and are located in all major naval purchasing activities and in the Offices of the Inspectors of Naval Material.

One effective way to help small business is to set aside total procurements or parts of procurements exclusively for negotiation with small business. This is done generally when limiting of competition will not result in payment of unreasonable prices by the government.

In addition, the Navy Department in 1954, in cooperation with the Army, Air Force and other Federal agencies, developed the Industrial Assistance Program. Under this program, businessmen are advised of trends and needs of the services by means of procurement conferences, exhibits of items needed, and other activities to stimulate interest.

The coordination and direction of "material matters" in the Navy are the responsibility of the Assistant Secretary of the Navy (Material) assisted by the Chief of Naval Material. Under his guidance, the technical bureaus and offices are responsible for providing the Navy's needs.

Each of these offices or bureaus designs, procures, controls and maintains those segments of equipment coming under its particular cognizance.

This includes some 36,000 major end items such as ships, missiles, planes, communications devices etc., and more than 1,200,000 secondary supply items needed to support, operate and maintain the major equipment. This latter replenishable material includes 800,000 repair parts and 400,000 consumable and general supply items.

The Bureau of Aeronautics is charged with maintenance of superiority of the U.S. Navy in the air. In addition to the procurement of aircraft, BuAer is charged with procurement of the air-to-air and air-to-ground missiles. As with BuOrd, BuAer is interested in research and development work in its own field.

The Bureau of Ships is charged with design, building, conversion and altera-

tion of naval vessels, including the missile launching surface units and the submarines including *Polaris*.

The Bureau of Supplies and Accounts fills many needs throughout the Naval Service. The Bureau, through a network of more than 200 decentralized offices throughout the country, spends annually more than $2 billion to acquire more than a million items.

This procurement covers almost all categories of consumables, repair parts and technical items including electronics and special parts for guided missiles and support equipment including nuclear powered submarines for the *Polaris* missile system.

The Bureau is interested in expanding its procurement sources and encourages competition from both large and small business alike. It invites all qualified suppliers to have their names placed on the Navy's bidding lists. An information brochure can be obtained from the Bureau of Supplies and Accounts (Code OZ), Navy Department, Washington 25, D.C.

The Bureau of Yards & Docks has the responsibility for the construction and maintenance of the Navy's shore establishments. Also, through the Naval Civil Engineering Laboratory, Port Hueneme, Calif., the Bureau conducts broad research, development, testing and evaluation of methods, procedures, materials and equipment pertinent to its field of endeavor.

Civilian contractors interested in work for the Bureau, or inventors, researchers and others who wish to investigate possibilities or bid on work should contact one of the Naval District Public Works Offices located in various large cities.

The Bureau of Medicine & Surgery procures its supplies through a joint procurement agency—Military Medical Supply Agency, 84 Sands St., Brooklyn 1, N.Y.

The Office of Naval Research is responsible for sponsoring both basic and applied research. Its fields of interest to date include all the basic sciences such as physics, acoustics, chemistry, geophysics, electronics, mathematics, statistics, mechanics, systems analysis and others.

The Marine Corps., which is part of the Naval Establishment, through its Quartermaster General, procures electronics and engineering items, refrigeration and air conditioning equipment. Much of its procurement is carried out through contracting officers at the Marine Corps Supply Activity, 1100 South Broad St., Philadelphia, Pa.

The Navy's overall policy in procurement provides that research and development contracts be awarded on the basis of comparative technical ability in the specific science or technology involved in the work. Because of the exploratory nature of the work, and the uncertainties of successful accomplishment, cost-reimbursement contracts generally are used in this field.

Consequently, the award of such contracts normally is based on the comparative ability of the proposed contractors rather than on comparison of the estimated costs, since in cost-reimbursement contracts advance estimates of cost do provide a valid indication of the actual final costs.

So that there will not be unnecessary waste and cost involved, the Navy usually requests technical proposals only from firms which have been technically evaluated and believed qualified to do the work involved.

When applications are received, the Navy reviews the prospective contractor's management techniques, his compliance with the Department of Defense policies and thoroughly investigates the subcontracting plan.

PROCUREMENT & PRODUCTION, MISSILES, FY 1960

How To Do Business With the Army

This article show the businessman how he can get part of the Army missile dollar. Included also is a list of current Army missile and rocket systems and their prime contractors . . .

THERE ARE two basic ways for a businessman to get a part of the Army missile dollar. One way is get a contract to do certain research and development work, or as the prime contractor for a missile or system. The second approach—and the one through which the greater part of the business volume is channeled—is as a subcontractor to a prime or as a supplier of parts, components or services.

The prime contractor who gets a research and development contract, usually for an entire missile system, is responsible for the initial production of all system components including the missile, launching and handling equipment, guidance, documentation and test equipment. While the prime has the overall responsibility, in most cases the dollar volume of the subcontracted components far exceeds the value of the components manufactured directly by the prime contractor. This, naturally, depends on the capabilities of the prime and the scope of the entire system.

Selection of a Contractor

Selection of a contractor for production of a missile system or components is achieved through formal advertising and negotiation. Selection is based on a number of criteria including production capability, reliability, costs, quality of the company's commercial or military products, and specific production requirements for the particular item being considered.

Consequently, it is important that the Army know what each industrial firm can do. The overall responsibility for the Army missile program has been assigned to the U.S. Army Ordnance Missile Command, Redstone Arsenal, Alabama, under the jurisdiction of the Chief of U.S. Army Ordnance Corps. The Army Ordnance Missile Command (AOMC) maintains a source file on industrial firms.

Those interested in doing business with the Army should supply the following information: name and type of company; total number of employees including research scientists and development engineers or other technical personnel; plant space and equipment including laboratory equipment and other facilities for research and development work; security clearance if a "facility clearance" is held for Army, Navy or Air Force work; general information on engineering capability and commercial and defense products; financial statement and descriptive brochure or any other information which would help in determining the full capability of the company.

Regional points of contact are provided by the 11 Ordnance Districts (see listing). Each of these districts maintains lists of items to be procured. AOMC normally requests the Ordnance Districts to secure quotations when a supplier of missile items is to be selected. After evaluation and bids, AOMC will request the District to prepare a contract with the selected supplier.

While contract administration always is the responsibility of AOMC, under certain circumstances procurement may be allocated directly to the Districts for selection of suppliers and contractural action.

An interested contractor or supplier is given an opportunity to review such research and development drawings and specifications are obtained before submitting formal proposals or bids. This information can be had from the 11 District Offices. A security clearance may be required to obtain this information and details as to subcontracting possibilities. It is of prime importance that prospective Army contractors and suppliers maintain contact with the Ordnance District Offices.

By its very nature, the procurement of guided missile systems and the replenishment of spares, is different from procurement of other items. Frequently, urgency of the program will not permit normal competitive procedure until late in the program. The more information the District Office and AOMC has on a company, the better its opportunities for selection.

New Army Procedures

The Army welcomes ideas for new weapons and material items voluntarily generated by industry and civilian organizations. However, there have been cases where costly voluntary efforts resulted only in disappointment because the ideas were not sufficiently compatible with the factors which must be considered by the Army.

To assist prospective contractors the Ordnance Corps has published Order 7-58 which establishes some new procedures to aid in the availability of information as to what new items the Army would like to have developed. Any interested U.S. civilian organization which has a suitable R&D capability, has the necessary clearances and has signed the policy agreement form can now obtain information on what the Army wants.

The required Policy Agreement form may be obtained from the district offices. If the company already is working with Ordnance on an R&D type contract, queries may be submitted directly to the Ordnance Commodity Command or the Commodity Arsenal with which it has been dealing. This is because they already are familiar with the company's capability. Where such

work is not in progress, or the company wishes to expand into areas not covered by current contracts, the query should be submitted directly to the nearest Ordnance District Office. The District Office will then advise as to how to become a qualified organization and put the company in touch with the proper Commodity Command or Commodity Arsenals.

Normally, development requirements information will be released only from the Ordnance Commodity Commands and Arsenals. This may be done by means of interviews, group briefings, distribution of written documents, or by correspondence. However, for the present, it is anticipated that group briefings will be the principal method.

Inasmuch as a missile system in its final operation draws on practically every agency and corps of the Army, business opportunities in support of the missile program can be developed through other units, as well as the Ordnance Corps. For information as to the proper agency for R&D work, queries should be submitted to the Office of the Chief, Research and Development, Department of the Army, Washington 25, D.C., Attn.: Technical Liaison Office. This office maintains a list of items and activities with which each of the technical services and commands of the Army is concerned.

Such proposals should be complete and concise with full information on the proposing firm and a discussion of the proposed work in terms of objective and scope.

If the proposal is accepted, a contract may be negotiated between the organization and the apprpopriate agency. If it is not accepted, the government is not obligated in any way to reimburse the firm for costs it might have incurred in submitting the proposal or seeking the contract. Corps, and their fields of endeavor include:

Corps of Engineers—most of the support equipment for missile systems, rockets and satellite programs. This involves a variety of work such as: construction and maintenance equipment; launching towers; cover and concealment of weapons; electrical equipment such as generators and converters; fire-fighting equipment; industrial engines including turbines; industrial gases and compressors; infrared and night vision equipment; liquid fuels distribution; mapping, geodesy and surveying materials; nuclear power and heating plants; prefabricated buildings and other areas of interest.

Ordnance Corps—in addition to weapons, Ordnance has cognizance of fire control equipment and material; fuels and lubricants.

Quartermaster Corps—chemicals and plastics; environmental protection; individual clothing and equipment which should become more important with the development of nuclear power for missiles and the attendant hazards of radiation and decontamination; mechanical equipment; and test materials and techniques.

Signal Corps—avionics; electronic countermeasures; electronic data processing systems; infrared, ultraviolet, meteorological instrumentation; radar; radio and wire communications; radio direction finding; sound, and light and television.

Transportation Corps—air, marine, motor and rail transportation.

Chemical Corps—biological agents; chemical agents; incendiaries; protective equipment; screening agents; smokes, weapons.

Army Medical Service—all basic research in medical sciences.

For research in areas of personnel training, motivation and leadership, the Army has the Human Resources Research Office in Washington.

The current list of Army missile and rocket systems and their prime contractors include:

Corporal—Firestone Tire & Rubber Co. (missile and ground handling equipment), Gilfillan Brothers, Inc. (ground guidance equipment).

Hawk—Raytheon Manufacturing Co.

Jupiter—Army Ballistic Missile Agency (missile system) and Chrysler Corp. (missile fuselage and assembly and ground equipment).

Honest John—procurement responsibility for this rocket, with the exception of the fins and warhead compartments, has been transferred to the Commanding General, U.S. Army Ordnance Ammunition Command, Joliet, Ill. Ground equipment is under the authority of the Commanding General, U.S. Army Ordnance Weapons Command, Rock Island, Ill. Fins and warhead compartments are under Emerson Electric Mfg. Co., one of the prime contractors.

Lacrosse—Cornell Aeronautical Lab., and The Martin Company.

Nike—Western Electric Company; Goodyear Aircraft Company and Borg Warner Corp. (solid sustainer motor booster motor). Procurement of booster motor metal parts is the responsibility of the Commanding General Army Ordnance Ammunition Command, Joliet, Ill.

Pershing—The Martin Company.

Plato—Sylvania Electric Products, Inc.

Redstone—Army Ballistic Missile Agency and Chrysler Corp.

Sergeant—Jet Propulsion Laboratory (missile system) and Sperry Utah Engineering Lab. (all critical R&D components).

The Army has issued a statement which reads:

"It seems quite clear that a company which aspires to become an important factor in the guided missile industry in the role of a prime contractor should strive to attain a position of being able to assume full responsibility for system development and program management. The smaller company would do well to concentrate on superiority of individual components so that their reputation for reliability, superior performance, and better cost will lead prime contractors to their door."

How To Do Business With NASA

National Aeronautics and Space Administration was added this year to the list of contracting agencies in the missile business. Outlined here are some of NASA's procurement procedures . . .

ANOTHER NAME has been added this year to the list of contracting agencies in the rockets and space development field. Under the National Aeronautics and Space Act of 1958, signed into law by the President July 29th last year, the charter and responsibilities of the National Advisory Committee on Aeronautics was expanded. NASA was given the overall responsibility for the nation's space program which the Act stated "should be devoted to peaceful purposes for the benefit of all mankind."

Generally speaking, NASA procurement follows the provisions of the Armed Services Procurement Regulations. This normally is by formal advertising for competitive bids where the supplies, materials, equipment or construction work can clearly be defined in drawings or specifications. However, in the case of research and development and other instances where such specification is not feasible, procurement is through negotiation with qualified firms.

The greater part of the procurement and contracting for services is carried through the field stations. However, any contract in excess of $25,000 must be countersigned by the NASA headquarters. All contracting negotiation and administration is performed via the field stations except in certain cases when the items or work sought does not fall specifically under the cognizance of one of the field stations.

NASA normally negotiates its own contracts with prime contractors. This is done directly with the contractor by NASA's own staff for contract negotiation and administration. A flexible procedure is employed which permits use of the services of the Department of Defense or other governmental agencies, as NASA sees fit. NASA's own technical direction, including project officer supervision, for all prime contracts is used except for standard hardware items more easily obtained by extension of already existing military contracts.

The actual level within the NASA organization responsible for the detailed technical direction and execution of the particular project negotiates with research and development contractors.

To the maximum extent possible, small business is given opportunity to participate in supplying NASA's supplies and services.

For actual procurement, NASA employs a decentralized system. This means that all equipment and supplies needed by a NASA field station are procured by the procurement officer at that station. Each of these procurement activities maintains its own bidders list, and should be contacted by those wishing to participate in NASA's procurement (see listing).

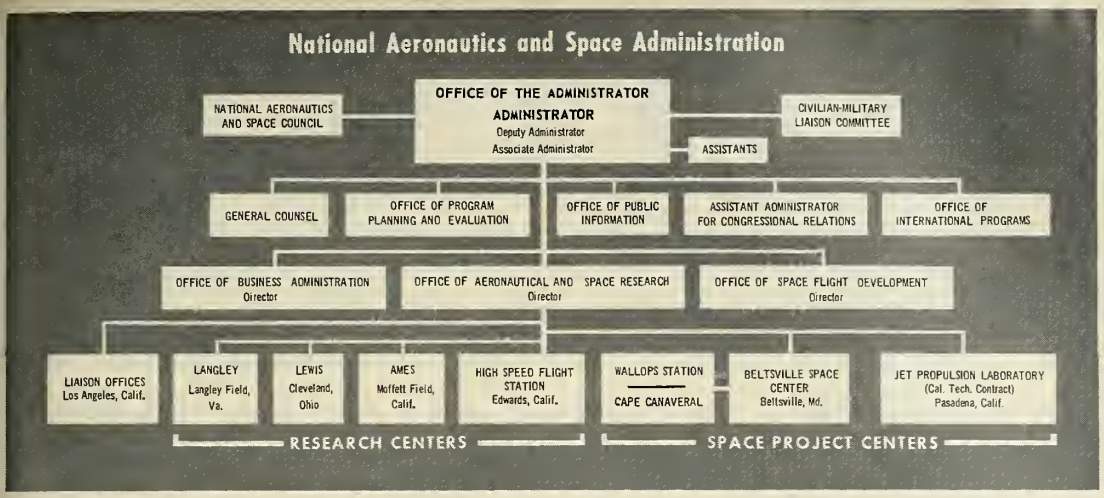
Advertising Procedures

In the case of purchases by formal advertising, strict adherence to a prescribed procedure is followed. At a specified time bids are opened and the bid most advantageous to the government is accepted. Upon award, the accepted bid becomes a legally binding contract.

When formal advertising does not meet the needs of NASA, procurement by negotiation is permitted. This method is when experimental, developmental or research work is involved or the urgency of the situation demands it. However, it is the policy of NASA to assure full and free competition as far as possible. Award in such cases is made in the best interest of the government considering price, delivery, quality of the product and other factors based on the origin proposals or negotiation.

NASA reminds would-be contra tors preparing their bids to watch fo special conditions relating to material packing, packaging and delivery whic may vary from the standard printe instructions. Any bid which does n conform to the requirements of th invitation for bids will be rejecte All bids may be rejected when reje tion is in the interest of the gover ment, or when the contracting offic does not consider the bids reasonab nor arrived at independently, or fee they are collusive or in bad faith.

Generally speaking, NASA em ploys the fixed-price contract for bot advertised and negotiated procuremen Certain variations of the fixed-pric contract is used for price redetermina tions where the performance of th contract may involve large contin gencies or uncertainties in costs.



Cost-reimbursement contracts ar reserved for certain situations and ma be awarded with or without a fee. I emergencies, or under unusual circum stances requiring maximum reductio of procurement lead time, letter-of-in tent contracts enable the contractor t begin work pending negotiation an execution of the actual contract.

Cost - plus - percentage - of - cos contracts are prohibited by law.

Although contractors are expecte to be fully qualified and competent t carry out the contract including th financial requirements, when such wor will result in serious drain of the con tractor's working funds, the govern ment may provide financial assistance

In addition, the Small Business Ad ministration can grant loans to sma concerns for the financing of plan construction, equipment or for use a working capital.

NASA recognizes the increasin

e of quality control techniques by dustry and emphasizes the impornce of quality in all supplies and parts ed in the highly complex space vecles and equipment. Before materials e accepted, they are subject to inection for compliance with contract ecifications.

As with the military services, frently a facility clearance is required r NASA contracts. This is necessary henever access to classified matter is quired either by the contractor or his ployees. Subcontractors on classified jects should obtain a facility securi clearance via the prime contractor.

Most of the supplies purchased by ASA conform to the federal or mili y specifications on quality, size, perfmance etc., available from the Government Printing Office.

As with other government agencies, it's the policy with NASA to include in contracts involving employment of lor, a provision obligating the contctor not to discriminate against any employee or applicant for employnt because of race, religion, national gin, or color.

NASA points out that in research al development work especially, the competence of a firm is not always dermined by its size. Contracts for RD are awarded on a basis of highes competence in the specific branch oscience or technology required for successful execution of the project.

In addition, NASA each year lets a umber of research grants and contrts to educational institutions and nd-profit organizations. These contrts involve research of two general tys—supporting research and fundamtal research. Research proposals shld be submitted (10 copies will falitate evaluation) to the National Aonautics and Space Administration, 150 H. St., N.W., Washington 25, D.C. marked for the attention Research Grants and Contracts Office. All such contracts are handled by the NASA headquarters and not by any of the field stations.

While bona fide representatives are permissible, the "Covenant Against Contingent Fees" clause included in all NASA contracts is warranty by the contractor that he has not retained other parties in soliciting or securing the contract. Breach of this warranty may result in an annulment of the contract or recovery by the government of the amount of fee already paid. Employees or established commercial or selling agencies maintained by the contractor to secure new business can represent the firm.

List of products—A representative list of items and supplies procured by NASA follows:

Abrasives; Air Conditioning Equipment and Supplies; Aircraft Maintenance Equipment and Supplies; Building Materials; Castings; Chemicals; Chemical Laboratory Equipment and Supplies; Clothing, protective; Communications Equipment; Data Recording and Processing Equipment; Drafting and Illustrating Equipment and Supplies; Electrical Maintenance Shop Equipment and Supplies; Electrical Power Distribution Equipment and Supplies; Electronics Hardware and Supplies; Electronic Instrumentation Equipment; Electronic Test Equipment; Forgings; Foundry Supplies; Gases, compressed; Gases, liquefied; Hardware, all kinds; Janitorial Supplies; Lumber; Machine-shop Services; Materials Handling Equipment; Materials Testing Equipment; Mechanical Power Transmission Equipment; Metal Fabrication Services; Metal Finishing Equipment and Supplies; Metal Heat Treating Equipment and Supplies; Metals, ferrous; Metals, non-ferrous; Metals, precious; Metalworking Equipment and Supplies; Missile Structural Components; Office Equipment and Supplies; Offset Printing Equipment and Supplies; Oils and Greases; Paints; Painting Equipment and Supplies; Photographic Equipment and Supplies; Plastics Materials; Plastics-working Equipment and Supplies; Plumbing Supplies; Pressure Systems and Equipment; Pressure Vessels; Reproduction Equipment and Supplies; Safety Equipment and Supplies; Shop Furniture; Telemetry Equipment; Vacuum Systems and Equipment; Welding Equipment and Supplies; Weldments; Wind Tunnel Instrumentation Equipment and Supplies; Woodworking Equipment and Supplies.

What a Prime Seeks from a Sub

A prime contractor official describes the weapon system concept and explains what a weapon system contractor expects from the suppliers . . .

by Rulon Nagely
Corporate Director, Material
North American Aviation, Inc.

THE RELATIONSHIP between a weapon system contractor, and his uppliers and subcontractors is perhaps ne of the most important elements in oday's defense picture.

A well-established, smooth work- ng relationship can lead to increased roduction efficiency and can save the overnment thousands upon thousands f dollars. On the other hand, poor co- rdination between the key organiza- ons can only result in wasted time nd effort, financial loss and, in ex- eme cases, perhaps could lead to the limination of the particular weapon ystem involved.

To fully understand the problems volved, it is important to first under- and the method of procurement hich is described as "the weapon sys- m concept." Historically, the various ilitary contractors, particularly those oing business with the Air Force or e Navy, were responsible only for e design and production of the pri- ary piece of equipment. In the case aircraft manufacturers, this was the rplane itself; the Government fur- shed such items as engines, wheels, akes, instruments, radar equipment, ros and so on.

Only occasionally was the contractor involved in the selection of these items.

The concerned government agency, in effect, acted as weapon system contractor, utilizing a number of subcontractors to furnish the necessary components which when assembled, became a finished, flyable airplane.

The system had certain advantages, not the least of which was that the prime manufacturer was absolved of the thousands of details—and the resultant headaches—that go with the procurement of the many pieces that make the whole.

Time for a Change

However, there were many more, and overriding, disadvantages. All too often the airplane manufacturer found that a vital equipment item would not work properly, or was incompatible with the balance of the system; making the necessary adjustments often delayed the whole program. Delivery schedules were not always as well planned as they should have been. Making major design changes while in the middle of a contract was very difficult and was often expensive because some completed hardware was no longer usable, but had to be paid for.

Where did the fault lie? In few instances could the responsibility be pinpointed to any one group, company or agency. Since there was no clear-cut line of responsibility, confusion and difficulties were unavoidable.

With the advent of the space age, it became increasingly obvious that the problems encountered through this procedure must be eliminated. The newer weapons then envisaged demanded the most exacting coordination and cooperation throughout the defense industry, and required a pooling of the most advanced scientific knowledge, the most specialized technologies, and the newest industrial skills.

The result: the so-called "weapon system concept."

Under this procedure, the prime contractor is held fully responsible for the success of the program, with only a very few, if any, items being furnished by the contracting agency. It is up to the contractor to find the proper equipment item for a given task, to see that delivery schedules are met, and that a high standard of quality, engineering and reliability is maintained. It is up to the contractor, also, to make certain that costs are held within prescribed limits and a very close cost control is

Rulon Nagely, Director of Material for North American Aviation, Inc., was promoted to his present position in 1951 from Purchasing Agent. He joined North American as Purchasing Agent in 1941.

Nagely first entered the aircraft industry in 1937 as purchasing agent for Vultee Aircraft Co., where he remained until 1941.

Nagely is Chairman of the Aerospace Industries Association's Materials Committee and is a member of the U.S. Air Force Advisory Group-Small Business.

maintained by the weapon system contractor.

In the case of today's complex weapons. these procedures involve far more than just selection and purchase; in many, if not most, instances the needed systems and subsystems are nonexistent. The contractor must first determine exactly what is required, he then must not only find the proper company to develop the item, but must also expend considerable effort of his own in assuring that the development process results in getting the right item on schedule and at a minimum expense.

North American Aviation is now weapon system contractor for two major weapon systems, the B-70 Valkyrie, intercontinental jet bomber, and the F-108 long-range jet interceptor. Both are designed for high altitude performance in the Mach-3 range. Under the latter two programs, the only items furnished by the Government are the engines; all other items, including fire-control flight control, mission and traffic control, electronic countermeasure and bombing-navigation systems, as well as other equipment that formerly would have been government-furnished equipment, are now North American's responsibility. We are charged with selecting, ordering and coordinating the manufacture of all the various components and subsystems which will go in to the B-70 and F-108. Moreover, we are also responsible for the ground-handling equipment, servicing equipment and everything else necessary to make the complete weapon system operate properly.

There should be no misunderstanding: the government is still deeply concerned with these programs and through the concerned weapon systems project offices keeps a close and constant watch over what we are doing. However, the responsibility is North American's.

Criticism of Procedure

There has been some criticism of the weapon system procedure, most of it on the basis that costs will increase and that small business will be squeezed out of the picture.

As to the first charge, we fully believe that is an unfounded fear. It is true that some of today's projects are staggeringly expensive as compared with World War II weapons; this is due to the increased complexity of the systems, not to the change in procurement procedures. Additionally, costs under the weapon systems concept can actually be determined and controlled because they are in one spot; previously, these costs were scattered over so many areas, and through so many agencies and companies, that it was almost impossible to determine and control the true and absolute cost of any single completed aircraft.

As to the second fear, we know that there is no basis for its existence. The small businessman will continue to play a vital role in the procurement picture and indeed, may even have increased opportunities for business. The business is still there, and the small businessman will get his share.

Changes in the System

The only basic change is that he will be dealing at a different level; in most instances, he will contact, or be contacted by, a prime contractor rather than a weapon system contractor.

The latter—whether one company or as in the case of some weapon systems, a group of related companies—will simply have moved up a rung on the ladder. The weapon system contractor will be handling most of the duties heretofore handled by the services, the major subcontractors will have replaced the prime contractors in certain procurement situations, and so on.

This means, of course, that the weapon system contractor will not have as much direct contact with the small business firm as has been customary in the past.

The size and scope of today's weapon systems demands that a greater portion of the business be subcontracted with major manufacturing concerns than in the past. It is doubtful that any one company in this country could handle as much as one-half the work involved in the design, development and production of a major modern weapon system.

For example, in the case of the B-70, we have named Boeing Airplane Co. as the subcontract for a wing section. This particular subcontract involves considerable engineering and design effort, as well as actual manufacture. It could not have been handled by a small concern and still have met design requirements and delivery schedules.

Boeing, in turn, will subcontract many of the items that will make up this section—and this is where small business will get its share of the program.

Other major subsystems are being handled in the same manner.

North American has taken several steps to insure that small business does, in fact, participate.

We require our suppliers, on eve purchase order or subcontract of $10(000 or more, to supply us with quarterly report on his small busine subcontracting; he in turn must inse a similar requirement in all of his pu chase orders and subcontracts in th amount.

We notify the regional office of tl Small Business Administration, as w as the Small Business Specialist of tl appropriate branch of the Armed Ser ices whenever a purchase order or su contract is let that appears to off opportunities for small business pa ticipation.

Each of our buyers is required make a "small business checklist" c each purchase, showing whether tl order went to large or small busines and if the former, whether small bus nesses were solicited and why they d not get the order.

Through these and other pr cedures, we are confident small bus ness will get its fair share of the wo on these weapon systems.

Approximately 80 per cent of tl work on the B-70 and F-108 will g to other companies, most of who would be prime contractors to the go ernment in a different situation. The companies will continue to let at lea the same amount of work to small concerns as they did in the past.

These procedures, while establishe by North American for specific pr grams, are essentially the same as wi be followed by other weapon syste contractors. The details may differ, b the basic philosophy will be the sam if for no other reason than the con plexity and size of the programs no being conducted.

Position of Contractor

It is readily apparent that tl weapon system contractor is placed in peculiarly vulnerable position. Holdir a tremendous responsibility for succe of an expensive program of great in portance to our defense picture, he at the same time cut off from dire contact with many of the people wh could increase costs or otherwis cripple the program.

The weapon system contractor mus therefore, be very demanding in h relationships with the immediate sul contractors and suppliers. He mu establish firm ground rules for oper tion, must make certain that all r quirements are met, and must be read to insist on competent performance o the part of both his own subcontracto and those companies on the third an

ourth tiers of effort.

The weapon system contractor must upervise and control the cost and the rogress of all work, and periodic reorts on these items from subconractors are a necessity.

Examination of these reports might ndicate inefficiencies or schedule slipage. In such a case, the contractor ust be prepared to take any steps ecessary to correct the situation.

uality Control

Quality control is extremely impornt, and here, too, the controller must vigilant. The subcontractor is, by rtue of his role, primarily responsible r high standards of workmanship. here quality is not up to par, the eapon system contractor must reserve e right to be arbitrary in demanding work or, if necessary, rejection. ithin the limits of sound working relationships, he must have the right to supervise the quality control procedures established by the other company.

And finally, the weapon system contractor must make certain that there is fast, clear, and accurate communication, not only with the subcontractor, but also between that organization and the others participating in the program. Red tape must be kept to a minimum, and decision-making must be prompt. This is a two-way street, and the weapon system manager has an equal responsibility to his subcontractors to provide fast and accurate information regarding changes of any kind.

The objectives of a particular weapon system program can only be met if this pattern is established at the beginning of the program and maintained to its completion. There must, naturally, be a certain amount of give-and-take on both sides, but essentially, the subcontractor must recognize that ultimate responsibility rests with the weapon system contractor, and that his demands must be met if the program is to succeed.

Working Relationship

This is the same businesslike relationship that should exist between two companies under any procurement system. The difference lies only in the size and complexity of today's weapon systems, and the increased responsibility that falls upon the weapon system contractor.

If these requirements are understood by all parties, and followed from the initial steps in contract negotiation, then there can be assurance that the government and the citizen will receive what is justifiably their due: a reliable, high-performance weapon system, delivered on time and at a minimum of cost.

★ ★ ★

What a Sub Seeks from a Prime

Profit is not the only thing the subcontractor seeks when he does business with a prime. Recognition of quality, courtesy, and fairness are major needs, says this defense industry expert . . .

by John Marschalk

THE NUMBER ONE thing a sub seeks from a prime is a chance to make a profit on quality work. Most primes recognize that a subcontractor has to make a profit to deliver a quality product and stay in business.

This means that *recognition of quality* is next to the top of the list of what a competent subcontractor wants. Years of operation with minimum rejection rates and prompt deliveries ought to mean more than lowest initial price, most qualified suppliers believe. And experienced buyers usually agree. With the heavy emphasis on reliability of supersonic weapons, this would seem to be the only way to buy. Even so, there are many do-good-to-small-business people who keep insisting that award to the lowest bidder (regardless of relative quality) is the "American way" to buy.

Competitive bidding on price alone may be completely satisfactory on common supply items like rope, nails and paper clips—where specifications can be fixed for a period of years. But the firms who work on the technical components of weapons think a low-price award is the certain way of assuring either default or poor quality.

I can think of no better word than "courtesy" for another want expressed time and again by small subcontractors with whom I've talked. They tell me that too many buyers take on a "power-of-God" attitude when dealing with representatives of smaller firms. It is human, I guess, to think of one's

John Marschalk, a public relations consultant, has specialized for the past fifteen years in the problems of industry dealing with Government. Until recently, he was executive director of Strategic Industries Association, a national trade group of small and independent firms in the defense supporting industry.

self as being pretty important when the control over several millions of dollars worth of purchasing is involved. The fellow from the small firm who wants to talk about an order for $3,000 is likely to seem relatively unimportant in the midst of such grandiose activities.

Here, again, the experienced buyer knows that the fellow from the small firm may have something to offer which can save both the prime and the Government millions of dollars and maybe thousands of lives. As the Director of Material for one large company told me recently, "A buyer has to know a little bit about a lot of things. The people he buys from need to know a great deal about just a few things. We try to teach our buyers to listen. They buy better that way."

The most common and costly discourtesy to a small firm representative is to keep him waiting for an hour or more after an appointment time. Frequently the small firm caller is either head of his company or close to it. Every hour he spends away from his plant is a costly deduction from management time. Yet it is his personal know-how which the buyer needs most. He is the one person who can readily interpret buyer needs in terms of his shop's capacity.

To make the small firm representative drive for an hour to the prime plant, park in a lot a half mile from the buying office, and then cool his heels for an hour-and-a-half before getting a three-minute brush-off from a self-important buyer, is about the poorest way to treat a fellow human being, let alone the waste involved.

Fair Return for Design

Finally, among the things small subcontractors want is a fair return for design effort. A common practice with some prime buying departments is to put out an "envelope" specification, asking several subs to submit a design for a component to do a certain job with size and weight limitations. Each sub is expected to submit his design for evaluation, plus a price proposal for doing the work.

When the engineers at the prime choose what they think is the best approach you expect them to negotiate with the firm that submitted the best design. Most companies do handle it that way. Some of them don't. Son take the winning design, copy it ar send it out for bids from other con panies. If the company that submitte the best design isn't low bidder, he ge not a dime for his work. Worse tha that, we know of a couple of class cases in which the prime people sai in effect, "Thanks for the idea; no we know enough to make this ou selves."

The top managements of eve prime we know have no patience wi that kind of practice. It can almo always be traced to that rare sma minded individual who congratulat himself on pulling a fast one. To g such practices stopped is one of t main hopes of thousands of small su pliers.

Adding it up, there are four maj needs on the part of most small su contractors:

1) A *chance* to make a fair profi
2) Recognition of quality over pri
3) Courtesy in handling contacts
4) Integrity in dealing

This is not much different fro what the large firms want for the selves.

Why Subcontractors Go Gray...

"We have lost money on our subcontracting for the past two years in a row. If it were not for our coupling sales, we would be out of business."

The man who told me this two months ago heads one of the most experienced and reliable small subcontract firms in New York State. As an individual, he has spent more than twenty-five years in defense manufacture. He normally employs about 125 people; his shop is rated A-1 on quality and reliability by many major prime contractors for whom he has been a supplier since World War II. Yet he has kept "alive" only through his sales—mostly commercial—of a small proprietary item.

Why has he taken orders at loss figures for the past two years? His answer is simple: "You owe something to your people; if it isn't *too* much of a loss, we'd rather keep them working."

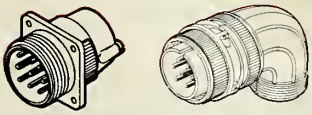
Losses are less than fun for any businessman. But what really gets under this particular subcontractor's skin is the conviction that more than a few buyers with whom he deals enjoy the situation. He described the method used by one large company not far from his plant.

"They have a bidding system. When a job comes up, they send out bids. They claim all their bidders have been qualified to do the job, one no better than another. My company has the lowest rejection rate you can find, but we start out bidding against other outfits who have nowhere near our quality record. So we know we're going to have to shave to the bone to get close.

"So our engineers spend a couple of days analyzing the prints, working out production methods, preparing our bid. This costs a lot of money, in itself. Sometimes it can pay off, though. Sometimes we find a real good way to cut production cost, so the bid we send in is lower than we expected we could do. Maybe it even turns out we're the low bidder.

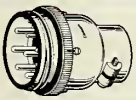
"But there's a hitch. They don't take the low bid. First thing they do is send it to their Cost Analysis boys. They try to find some holes in it. Maybe they call me on the phone and argue I figured too much for machine set-time or some other thing. Finally, I g a call from the buyer. Say I bid $2 apiece for each of twenty items. I tells me if I'll knock off $50 on ea piece, they will give me the job.

"I tell them to go hang. But y know what? They'll start calling t other bidders with the same pitch ur they find a sucker who will go alon



Although I heard the same sto from two other New York subco tractors with whom I visited, I'm p sonally convinced that this squee system isn't common practice. I have run into it in other parts of the coun and it may well be confined to t single prime about whom it was to In the only other case I know of p sonally, a contracting officer for one the military services bragged that had saved over a million dollars Uncle Sam in a single year by us this sort of system. When he was asl how many small companies had g broke as the result, he just shrug his shoulders.

—John Marsch

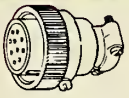


27,000 CANNON PLUG DESIGNS

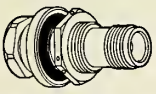
FOR EVERY CONCEIVABLE APPLICATION

AIRCRAFT AND ELECTRONIC INSTRUMENTATIONS—MS, MS-A, MS-B, MS-E, MS-R SERIES, conforming to Specification MIL-C-5015D. Vibration-proof—Lightweight—Plugs are available with from 1 to 100 contacts. 15 different insert diameters and 260 contact layouts. 6 shell styles, MS 3100 to MS 3108 with all accessories. Environmental-Resisting MS-E and MS-R Series have interfacial sealing at mating faces and integral grommet seal at wire entry plus—grounding lugs and integral cable clamp.

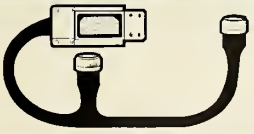
GENERAL CIRCUITRY AND QUICK DISCONNECT—K, RK SERIES, with special acme thread. The all-purpose series with eight insert diameters available. Conduit and cable clamp entry types. 1 to 110 contacts. 10, 15, 30, 40, 60, 80, 115 and 200 amp. silver plated contacts. High quality phenolic, melamine, and formica insulators. Cadmium-plated aluminum alloy shells.



UNIT-PLUG-IN RACK/PANEL-DP, DPB, DPD, DPD2, DPD2R, DPJ, DPS SERIES, available with from 2 to 180 contacts in rectangular inserts. With and without shells; coaxial and high voltage contacts. Permit quick disconnect, interchange, replacement, testing, and inspection of assemblies and sub-assemblies.



AUDIO AND LOW-LEVEL CIRCUITS—P, XLR, XK, O, UA, BRS SERIES, in many shell styles and insert layouts. Straight and 90° angles. Latch-lock types. Wall-mounting, panel, locknut mounting, and adapter receptacles, single and two-gang. 10 and 30 amp. contacts, coaxials.



MINIATURE AND SUB-MINIATURE—D, US, DPA, DPX, AND K-MINIATURE SERIES, designed for amplifiers, miniature indicators, computer circuits, telemetering equipment, and general instrumentation of limited space requirements. Variety of shell styles, junction shells, and insert arrangements. Available with from 2 to 50 contacts, plus coaxials.

COAXIAL RF SERIES—available in a wide range of Series and types from sub-miniature to large cable applications. New Cannon adapters available for use with latest cable developments. Cannon's latest RF Plugs include aluminum versions designed for use where weight-saving is a critical design criteria.

GM AND PLUG HARNESS SYSTEMS—Cannon produces a wide range of GM Plugs to fit specific missile applications, ranging from straight umbilical dis-connects to stage-separation dis-connects. Cannon also produces Plug Harness Systems featuring MS or other specified plugs and cables as one unit, available with various contact types and sizes. From 8 to 140 contacts. Highest quality and proven reliability. Varied remote disconnect methods actuated by hydraulic, pneumatic, explosive, or manual means.

The **Cannon Electric Company** also has available a wide variety of plugs for Battery-Power, Fire-wall, Watertight, Printed Circuit, and other applications, as well as "Kwik-Term" Terminals and DC Solenoids.

FOR ADDITIONAL INFORMATION on the typical designs illustrated . . . other configurations for your specific applications . . . or the design, engineering and manufacture to your special needs . . . write to Cannon Electric Company—3208 Humboldt Street, Los Angeles 31, California. Please refer to Dept. 0000.

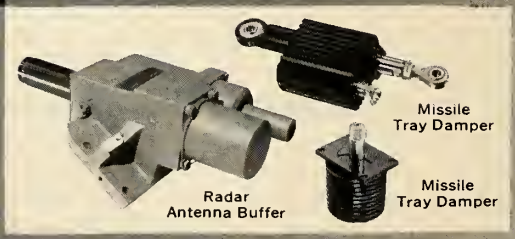
hydraulic and vibration control equipment

for airframe and missile applications

ROTARY ACTUATORS

Direct rotary torque output from 200 to 600,000 inch-pounds. Optional vibration damping may be incorporated. Broad range of designs and sizes, for hinge-line mounting.



FLUTTER DAMPERS

Performance-proved by acceptance on leading high-performance aircraft and missiles. Linear and rotary types to meet any control surface application, any envelope requirement. New Damperator combines Flutter Damper and Rotary Actuator functions.

STEER AND SHIMMY DAMPERS

Constant-torque power steering units, combined with shimmy damping. May be mechanically or electrically controlled. Full 360° swivel optional. New Viscous Shimmy Dampers for limited-envelope applications.

SPECIALIZED DAMPERS AND BUFFERS

Hydraulic buffers, installed at limits of antenna travel, protect sensitive radar components from damage caused by over-travel. Specialized damping devices for missile handling equipment.

ONLY A SPECIALIST like Houdaille can meet your most exacting specifications for hydraulic or vibration-control applications . . . completely, economically. When *original* product designs are required, Houdaille engineers will evaluate your needs and develop the *right* component to solve any problem. Extensive precision manufacturing facilities assure delivery to meet your toughest schedules.

The items shown here are typical of recent Houdaille designs. Each is outstanding in quality, dependability and performance.

WRITE FOR TECHNICAL BULLETINS on any of above products you are interested in, or for engineering assistance, send details of your problem to

NEW FASTENERS MEET MISSILE PROGRAM DEMANDS

Huckbolt fasteners fabricated from igh alloy die steels and a variety of tainless steels are now available from Huck Manufacturing Co.

The new fastener specifications ave been developed primarily to meet ecent demands for miniaturized fas- ener designs for use in new missile rograms. The new materials permit se of smaller, lighter components with o sacrifice in strength. They are rec- mmended for use in elevated tempera- ure applications where unusually high trength is required.

Among the new Huckbolt pin ma- erials that may now be specified are AISI Types 321 and 431 stainless teels, A286 and 17-4 PH stainless teels, Vasco Jet 1000 alloy steel and Thermold J alloy steel. Huckbolt col- rs for these applications are of AISI ype 430 stainless steel, annealed.

Fastener strengths formerly achieved nly at room temperature are provided p to 900°F by some of these materials. n addition, fastener performance has

been satisfactory in certain applications at temperatures well beyond 900°F.

Huckbolt fasteners of both shear and tension types as well as Huckbolt stumps can now be obtained in the new materials for the full range of nominal pin diameters (5/32-in., 3/16-in., 1/4-in., 5/16-in. and 3/8-in.) Alloy steel fasteners are available with diffused cadmium-nickel alloy plate where required in accordance with A.M.S. 2416.

lew Weldable Alloy olves Joining Problem

A new air-hardening, weldable and lly martensitic alloy has been devel- ped by The Carpenter Steel Co., to eet the need for a metal that can be ed for highly stressed parts at tem- ratures up to 1050°F where joining a problem.

The steel, known as Carpenter 404 loy, is designed to be free from weld acking without preheating or post- ating. Weldments can be readily cold rked after stress relieving or anneal- g.

The new alloy is recommended especially for applications such as steam turbine buckets, blades and bucket covers, as well as for "casting in" assemblies such as turbine diaphragms.

The new metal is essentially a 12%-chromium 1½% nickel composition having relatively high tensile strength and good ductility. It shows a marked improvement in weldability over stainless Type 410, and a more uniform structure and higher hardness than Type 405.

In the annealed condition, the steel is said to be easily blanked, drawn, formed or cold headed. Another advantage is its easy machineability in both the treated and annealed conditions.

Carpenter 404 alloy is made by the company's Mel-Trol process, a new quality control system with patented ingot design. Mel-Trol is used to minimize the causes of inconsistent centerline quality which so often causes erratic service in alloys of this type made by conventional methods.

The alloy offers resistance against a wide range of corrosives, including the atmosphere, fresh water, mine water, steam, carbonic acid, crude oil, gasoline, blood, perspiration, alcohol, ammonia, mercury, soap, sugar solutions and other reagents. It also has good resistance to scaling at elevated temperatures and can be used for continuous service up to about 1200°F.

Forms now available include forging billets; hot rolled bars and forgings, either annealed or heat treated; cold drawn and ground bars; wire and wire rods; and strip, both annealed and tempered.

Subminiature Devices May Be Smallest Power Units

The engineering laboratories of Ferrotran Electronics Co. have recently developed a new subminiature series of their "Powertran" power supply units which may be the smallest power supply package ever developed. They are manufactured in a molded or in an encased form.

The molded unit which is made for mounting on a printed circuit board is approximately the size of a flashlight battery. A typical unit measures 1 3/8" x 1¾" x 1¼". (Photo shows relative size of unit compared to a power transistor.)

Four stock units which will give any fixed d-c output voltage in the range from 10-30 volts are available. The 10 volt unit, for example, operating from 115 volts, 60 cycles will supply 25 ma. of current. It is well-regulated, ripple-free, and short-circuit protected.

The device is ideal for transistor supply purposes, bias purposes, or reference voltage purposes.

This series of power supply units is the smallest in the "Powertran" series.

Stock units are as follows:

Model No.	*D.C. Output Volts*	*D.C. Output Current*	*% Reg.*	*% Ripple*
SM-10-A	10	25 ma.	2.3	0.5
SM-15-A	15	20	2.3	0.5
SM-20-A	20	20	2.5	0.5
SM-30-A	30	15	3.0	0.5

Encased units are 1 5/8" x 1¾" x 1½" and are available with transformer type terminals, multiple pin headers, or as plug-ins. (7-pins or 8-pins)

Molded units are 1 3/8" x 1¾" x 1¼" and are furnished with short pins for mounting into printed circuit boards. The units may be solder-dipped.

A far greater current than shown above can be drawn from the unit, without overheating, at a somewhat reduced output voltage.

Temporary short circuits may be placed across the output without damaging the unit.

A BETTER NOZZLE MEANS A BETTER MISSILE

Nozzles for guided missiles are an important factor in performance and, of course, in cost. In the end result during their short-span service, they must produce proper thrust without disintegrating. In early production, despite their simple symmetrical shapes, they posed many knotty problems. Special alloys, thin sections, and close tolerances spelled trouble. So did their expendability, as always making costs a concern.

Today, after many years' production, we have delivered a staggering number of these problem pieces. The secret of our success has been our own unique Cameron forging

processes which have extended the scope of ferrous forgings far beyond traditional restrictions in shape, size and quality. Elimination of welds along with better grain structure, internal as well as external curvatures, and considerable machining economy have made these forgings increasingly popular.

Our forgings are available as forged rough machined, or finished machined, ready to save money in any phase of your operations. If you have a forging problem in components ranging from a few pounds to 8000 pounds, especially something for extreme service (high stress, high temperatures, etc.) we may have the answer. Special alloys are no problem because we produce our own steel with the most modern controls and tests from melt shop to delivery dock. Just call, write, or come by . . .

Designed especially for High Strength—High Temperature and liquid oxygen and other corrosive applications, Cherry Aircraft Lockbolts* are now available in austenitic A-286 Stainless Steel.

Available for the aircraft industry in a wide range of diameters, grip lengths and head styles in A-286 . . . Cherry Lockbolts are also produced in Alloy Steel and Aluminum.

Cherry Lockbolts are structural fasteners providing simplicity and speed of installation with uniform high tensile preloads.

Shop men like them.

For information on Cherry Aircraft Lockbolts, write Townsend Company, Cherry Rivet Division, P. O. Box 2157-Z, Santa Ana, California.

PROPULSION SYSTEMS AND AUXILIARY POWER UNITS

These units include the power plant and its associated equipment; such as, tanks, pumps, blast chambers, nozzles, resonance rods and fuel. Propulsion systems are simple in solid rockets, complex in liquid rockets. Auxiliary power units consist either of hot gas turbines driving hydraulic pumps and generators, or of batteries supplying power for missile guidance and control systems.

giving the "breath of life" to solid propellants!

TRONA® ...first and foremost source of supply for **AMMONIUM PERCHLORATE**

Advances in solid propellant technology have depended on AMMONIUM PERCHLORATE from American Potash & Chemical Corporation since the very beginning. First in the field with this essential oxidant, AP&CC was for many years the only domestic producer of ordnance-grade NH_4ClO_4. Today, with a growing network of strategically located plants and increased technical knowledge, Trona still leads the industry. Supporting the big tonnage production of AMMONIUM PERCHLORATE at Henderson, Nevada is the new SODIUM CHLORATE plant at Aberdeen, Mississippi, making AP&CC the free world's largest producer of $NaClO_3$. If a guaranteed source for AMMONIUM PERCHLORATE and the very latest in technical developments, gained through years of experience in this field, are important to your process and products, contact your nearest AP&CC sales office today.

KEL-F PLASTICS HAVE MISSILE APPLICATIONS

"Kel-F" polymers produced by Min-esota Mining and Mfg. Co. are noted r chemical inertness, low-tempera-re range, low "cold-flow" characteri-ics, all-round moldability, and easy achining.

Another useful property, especially r missiles and rockets, is the poly-ers' flexibility. Lip seals for rotating d reciprocating shaft seals and pro-ellant gate-valve seals must be flexi-e at temperatures from about –450 165°F. They also require spring-ack and dimensional stability to seal gainst low and high pressure, from 5 600 psi.

These qualities can be achieved by ecial heat treatment of "Kel-F" plas-cs to control physical properties. ensile strength of the plastics remains igh (up to 5800 psi at –300°F.), hile flexibility is maintained at these mperatures to withstand impulses and ycling as a seal from pressures of to 1000 psi.

Missile applications include:

Coil forms—Zero moisture absorp-on, good dielectric strength, and ex-llent dimensional stability make "Kel-" plastics an exceptional coil form aterial for missiles. Biggest problem solves is that it shows no effects om the extremely high temperatures ached by the wire wrapped around e form—temperatures that tend to ften and warp coil forms made of her materials.

Expellent bladders—Function of ese bladders is to store such highly rrosive liquids as LOX, WFNA, FNA, and 90% hydrogen peroxide the fuel chambers of missiles. Fabri-cated from plastic tubing and heat-sealed after loading, the bladders are usually employed as liners in stainless steel tanks. They range in diameter and length from ¼″ to 150″.

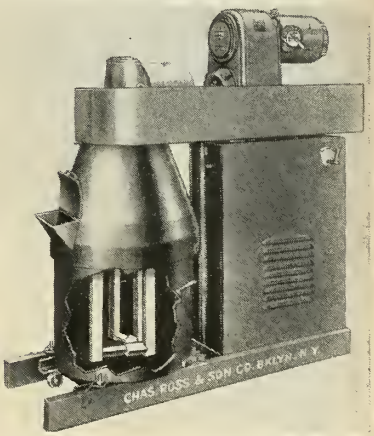
Gasket seals—Transfer-molded gasket seals, made of an elastomer O-ring mechanically-bonded to a square of anodized aluminum, are now being produced for nitric acid contacts in missiles. "Kel-F" polymers provide the only applicable elastomer that will withstand such contacts.

LOX lip seals—Chemical inertness and flexibility at the extremely low temperature of LOX are responsible for the wide use of "Kel-F" plastics in LOX lip seal applications. The material is first compression-molded, then post-formed and machined into seals of the desired shapes and sizes, with tolerances as close as plus or minus 1.5 mils with a 7 micro finish.

O-rings in rocket engines—Successful operation of a liquid rocket depends almost entirely on the proper functioning of its elastomeric parts. O-rings are used as shaft seals, gaskets, and valve seats. "Kel-F" elastomer was early applied in this area, mainly because of its resistance to WFNA.

Self-locking nuts—Inserts of "Kel-F" plastic prevent seepage of such strongly reactive missile fuel liquids as RFNA and WFNA past the internal bolt threads of self-locking nuts.

Sprays—"Kel-F" dispersion film, the most flexible of the polymers, is being used in many missile applications, chiefly diaphragms, as follows: the dispersion is sprayed on a metal form (which may be of any convolution or configuration); after baking, it is removed, yielding a component that is non-porous, tough and flexible.



Structural-thermal use—Because of high compressive strength and wide temperature utility, "Kel-F" plastics are the main structural support and thermal barrier between the outer shell and the "internal package" in Vanguard satellites. Major concentrated load of the package is carried directly through a "Kel-F" plastic support to the main hub at the base of the structure.

Vent seals—A small device injection-molded from "Kel-F" plastics is used to prevent moisture or foreign material from entering small bleed holes in rocket engine components. The seal also acts as a low-pressure, small-volume relief valve.

Machines Developed for Mixing Propellants

A complete new line of heavy duty double planetary change can mixers has been developed by Charles Ross & Son Co., Inc. for mixing solid propellants. The company, which also manufactures a line of horizontal type kneading machines for mixing propellants, has improved on the design of the vertical type changeable can mixer to incorporate many features designed specifically for propellant mixing.

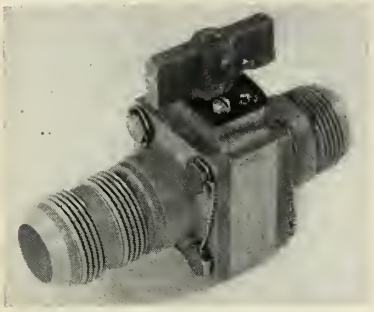
The double planetary change can mixers are available in many sizes from 1 gallon Laboratory size to 200 gallon large production size, and all mixers are furnished with variable speed motor drives. Nonsparking materials are utilized, and, aside from versatility in operation and ease of clean out of the changeable can type mixers, mixers of this type eliminate stuffing boxes and bearing in the product zone.

The double planetary changeable can mixers are furnished with stainless steel stirrers and can, jacketed cans, and vacuum covers when required.

Fill in No. 105 on Subscriber Service Card.

Propellant Valve Has Dual Flow Control

For simultaneous flow control of liquid Oxygen and Fuel, Hydromatics Inc.'s provides zero leakage control of a 5/8″ LOX line and ½″ fuel line at pressure up to 100 psi and temperatures as low as –350°F.



A single-acting, spring-return pressure actuator drives a precision mechanical linkage which controls both valves, thus insuring constant timing. The valves are extremely fast acting, with response times as short as 10 milliseconds. All dynamic sealing is double with a vent between seals for maximum safety. A sealed, rotary action snap switch permits remote observation of valve position. Valve flanges, available in standard or special styles, are removable and interchangeable.

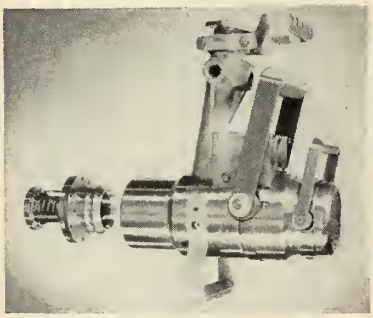
. . . new products

Koehler Ball Valves Have Missile Applications

An extensive line of KOEHLER/Dayton Ball Valves, Koehler Aircraft Products Co., is now available for missile in-flight and ground support applications.



KOEHLER/Dayton Ball Valves are ideal for use with standard fuels and oils, high energy fuels, oridizers coolants and cryogenics. They combine simple design and rugged construction and as a result are among the lightest and smallest available.

When functioning as drain, selector, fill and flushing valves, this ball type design can be actuated by manual, mechanical or electrical means.

Fuel Oxidizer Servicing Nozzle Designed

Missiles and ground servicing equipment require specially designed nozzles and adapters for fueling operations prior to countdown. Lear-Romec Division of Lear, Inc. has developed such a device for missiles embodying special design and materials, standardizing the equipment for filling oxidizer reservoirs and fuel tanks at missile bases.

Developed for dependability and safety in handling oxidants, the nozzle is fully capable of transferring any of the exotic fuels and oxidants except those requiring stoneware transmission equipment.

For "closed circuit" fueling operation, two nozzles are required to transfer propellant or oxidant from the supply source to missile and overflow venting from missile to source. Thru the three way locking action between the nozzle and its companion adapter (permanently mounted on supply source and missile) absolute leak and hazard-proof seal is effected.

Operation is satisfactory at temperatures ranging from –65 degrees to plus 140 degrees Fahrenheit, in accordance with the requirements of Military Test Specifications Mil-N-25556 (nozzle RR13110) and MIL-N-25555 (adapter RD13040).

Originally designed to accommodate fuming red nitric acid (HNO_3), only the purer and more advanced aluminum and stainless steels are used for their overall resistance qualities to the corrosive action of oxidants.

Fill in No. 108 on Subscriber Service Card.

Eckel Offers Miniature Three-Way Valve

Eckel Valve Co.'s Series BF42C is a miniature 3-way valve for small actuators and instrumentation systems. It operates to 70 psi—gases or liquids —with inherent minimum leakage. The current consumption is just 9 watts at 28V DC, and the valve is available either with electrical connectors or lead wires.

Because of the Eckel coaxial configuration, this new BF42C valve is only one-third the weight of previous "smallest" 3-way valves.

Lox Pump Motor Delivers 60 gal/min.

Recently developed by the J. C. Carter Co. for pumping liquid oxygen of liquid nitrogen is an electric motor driven two stage centrifugal pump. Designed to deliver 60 gallons per minute against a 550 ft. head, this pump is particularly suited for installations where light-weight, compact design is important.

Fill in No. 110 on Subscriber Service Card.

New Concept Featured in Liquid Sensing

A new Liquid Sensor featuring simplicity and greater reliability is now being produced by the Pioneer-Central Division of Bendix. The new Sensor which was developed to supplement the fuel measurement and control systems and the airborne liquid and gaseous oxygen systems with which Bendix has been identified is expected to have wide application in many related and unrelated fields.

The Sensor provides a new means of sensing the existence or level of liquids even in the presence of gas or vapor. It is adaptable to a wide range of applications—from sensing the presence of liquid at a given level in tanks to the critical measurement and control of missile propellants. It will function in fluids with widely divergent characteristics including the liquified gases, hydrocarbon fuels, red fuming nitric acid, fluorides, hydrazine, water ink and viscous fluids such as molasses.

The Sensor is currently available in the form of a probe with built-in transistorized amplifier and relay or, for other applications, with the probe separated from the amplifier and relay. Both designs are adaptable to different configuration and to dimensional changes to conform to specific requirements.

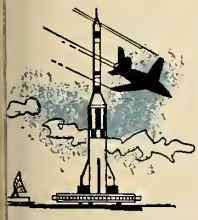
New Hydrogen Peroxide Nozzle Is Non-Corrosive

A new self-sealing, high flow rate hydrogen peroxide nozzle and adapter for servicing aircraft or missiles using hydrogen peroxide as an oxidizer has been announced by Flight Refueling Inc.

Safety requires the nozzle to be manually locked to the adapter before the internal valves can be actuated and collaterally, the internal valves must be completely closed before disengagement.



Another important feature is that working parts are fitted externally and do not come in contact with the fluid eliminating the possibility of corrosion.

DELIVERED—thousands of missile APUs

1. *Solid propellant—hydraulic output* 2. *Liquid propellant—hydraulic and electric output* 3. *Solid propellant—electric and mechanical drive output* 4. *Liquid propellant—hydraulic and electric output* 5. *Solid propellant—hydraulic and electric output* 6. *Solid propellant—hydraulic, electric and steering outputs*

AiResearch has designed, developed, manufactured and delivered thousands of missile accessory power units. Extremely reliable and lightweight, these various solid and liquid monopropellant APUs are completely self-sustaining within the missile system. Designed to minimum space and weight requirements, they are built to withstand high G loading and severe temperature extremes.

The several units pictured above provide hydraulic, electrical and/or steering surface control depending on the customer's requirement. Delivered horsepower ranges from 1.2 to 35 h.p. over hot gas operating durations from 30 seconds to 20 minutes. Electrical regulation is maintained as closely as ±½%. A significant advance in missile APUs is unit #6 pictured above. This package represents the first integrated hydraulic and electrical power unit providing a steering surface actuation system.

These tailored systems utilize the extensive hardware experience and complete laboratory, test and production facilities of AiResearch needed for quick and efficient quantity production of complex APU systems. AiResearch is the world's largest and most experienced manufacturer of lightweight turbomachinery—the key component of its APU systems. Your inquiries are invited.

BECOME A PART OF CAPE CANAVERAL'S BIG MISSILE NEWS THROUGH ON-THE-SPOT PARTICIPATION WITH PAN AM

PAN AM

The Guided Missiles Range Division of Pan American World Airways has prime responsibility for management, operation and maintenance of the 5000-mile Atlantic Missile Range. This responsibility and the division's dynamic growth create unique opportunities for high level engineers, physicists and mathematicians in the pioneer arts of missile range management, operation, maintenance and test data collection and reduction.

Please address your resume in confidence to Mr. J. B. Appledorn, Director of Technical Employment, Pan American World Airways, Inc., Patrick Air Force Base, Florida, Dept. B-7.

General Chemical offers Helpful Technical Data on ROCKET FUEL OXIDIZERS

- ✓ **Fuming Nitric Acid**
- ✓ **Liquid Fluorine**
- ✓ **Chlorine Trifluoride and other Halogen Fluorides**

To assist specialists working in the field of cket and missile propulsion, General Chemical now offers valuable set of product information bulletins packed with ysical and chemical data, tables and graphs. This infor- ation is based on General Chemical's extensive experience th these products as America's leading producer of lorine and fluorine-based chemicals, and one of the tion's primary producers of nitric and other mineral ids. The questions our customers ask most often about ese products are answered here.

re are the specific bulletins offered:

Nitric Acid, Fuming"—29 pages—Including detailed product description of both red and white fuming nitric acid, chemical and physical properties, corrosion data, directions for storage and handling.

luorine"—21 pages—Including extensive data on the chemical and physical properties of this most powerful oxidizing agent, a description of materials and equipment for handling gaseous and liquid fluorine, safety precautions.

hlorine Trifluoride"—35 pages—Including the chemical and physical properties of chlorine trifluoride and other halogen fluorides, recommended materials for use in halogen fluoride systems, directions for safe handling.

o available are bulletins on:

Handling Elemental Fluorine Gas In The Laboratory
Liquid Fluorine Unloading Procedure
Chlorine Trifluoride Vapor Pressures

ail coupon now for your free copy of any or all 6 of these valuable technical bulletins.

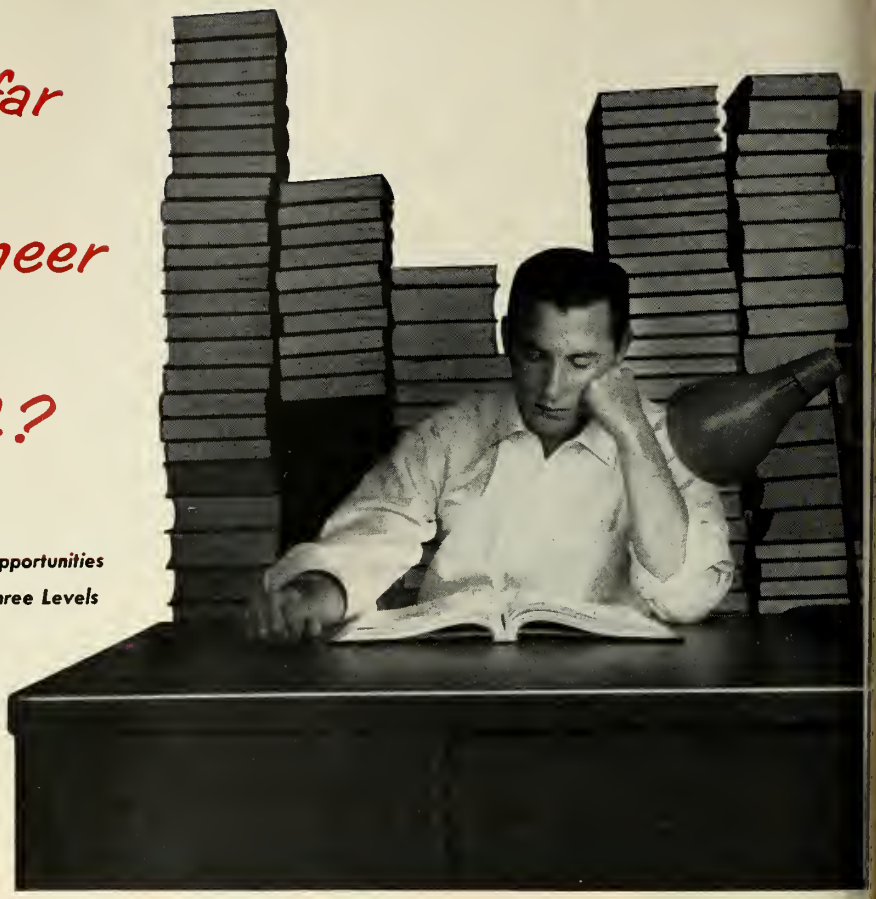
CONTROLS

FOR THE FULL SPECTRUM OF PROPULSION SYSTEMS



Bendix* has long been a leader in supplying controls and fuel systems for all types of aircraft engines. Today, Bendix is proving to be a natural for new challenges in related missile fields—on ram jets, rockets, nuclear power, and other advanced propulsion systems. So, when it comes to controls, remember that Bendix has the background—and is anxious to share it in solving your problems. *REG. U.S. PAT. OFF.

How far can an engineer go at AC?

Special Advanced Education Opportunities Develop Career Potential on Three Levels

If you are a graduate engineer in the electronics, electrical or mechanical fields, or if you have an advanced degree in mathematics or physics, you can work on AC's famous AChiever inertial guidance system or a wide variety of other electro-mechanical, optical and infra-red devices. You can also prepare for promotion and enhance your professional status through AC's free comprehensive training programs—the finest "in house" programs available.

Program A—for recent graduate engineers—gives you a solid foundation in the theory and application of inertial guidance systems and servomechanisms. You attend classes three hours per day for four months, all on company time.

Program B—for experienced engineers—consists of upgrading studies in inertial guidance, servomechanisms, environmental problems, engineering math and physics, plus advanced state-of-the-art courses. Time? —during working hours or evenings.

Program C—for all engineering supervisors—involves management training developed by a team of AC executives and University of Chicago industrial relations experts. Sixty one-half-hour sessions give you a solid grounding in management techniques.

These thoroughly practical courses—taught by university professors or recognized AC specialists—constitute AC educational "extras." AC offers them in addition to their educational assistance programs for men who wish to study for advanced degrees in nearby universities.

AC invites you to compare these advanced training offerings with those of any other company. Get complete details today. Just write the Director of Scientific and Professional Employment: Mr. Robert Allen, Oak Creek Plant, Dept. B, Box 746, South Milwaukee, Wisconsin.

REGULATED DC POWER SUPPLIES

HI-VOLTAGE SERIES

Designed for powering airborne electronics equipment under the most adverse enviranmental conditions, Arnoux High Voltage DC Power Supplies assure the utmost in reliability. These magnetic-amplifier reguloted supplies ore available in the range of 108 to 450 volts DC, with current ratings from 50 ma to 800 mo. Other ratings are also available on speciol order.

Model 250 S 025

ARNOUX

Input Power: 115 volts, 400 cps

Regulation:	Input (Variation)	Output (% Rated)
Line Voltage:	± 10%	± 0.25
Line Frequency:	± 20 cps	± 0.1
Load Current:	20-100%	± 0.1
	0-100%	± 0.2

Ripple: Less thon 0.05% rms ot full lood.

Output Adjustment: 5% odjustment ovoilable on request ot slightly higher price.

Environmental: Meets specificotion MIL-E 5272A for acceleration, vibration, altitude, humidity and temperature operating at 20% to 100% roted lood.
Also meets MIL-I 6181 B.

Connector: AN-type connector.

Mounting: Stud-mounted.

(Write for Bulletin 200)

LO-VOLTAGE SERIES

Intended for use in precision airborne instrumentation systems, Arnaux Low-Voltage DC Power Supplies ore available in both single and dual output. Ranging fram 5 to 50 volts at currents up to 10 amperes, these rugged units are hermetically sealed.

Model 5 S 10

ARNOUX

Input Power: 115 volts, 400 cps

Regulation:	Input (Variation)	Output (% Rated)
Line Voltage:	± 15 volts	± 0.10
Line Frequency:	± 20 cps	± 0.15
Output Load:	20-100%	± 0.05
	0-100%	± 0.10

Temperature Stability: 0.5% per 100°F. (— 60°F. to + 160°F.)

Ripple: Less thon 0.1% rms ot full lood.

Output Adjustment: Screwdriver odjustment provides ± 0.5 volt chonge. Wider ronge of odjustment ovoilable on request.

Connector: Stondord AN-type connector, or hermetically seoled heoder on request.

Mounting: Stud-mounted.

Environmental: Meets specificotion MIL-E 5272A for occelerotion, vibration, oltitude, temperoture and humidity.

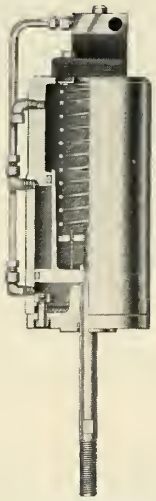
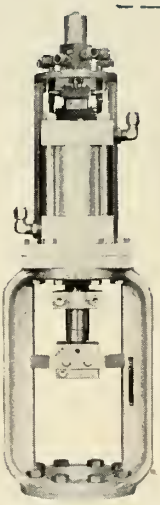
GROUND SUPPORT EQUIPMENT

This is the equipment that supports the missiles; such as, "go, no-go" boxes and other electronic checkout gear, liquid oxygen generators, fuel trucks, fire trucks, portable generators, launching pads and block-houses.



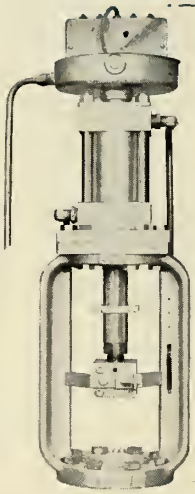
Annin OFFERS YOU MORE IN ACTUATORS

Your choice OF ADVANCED DESIGNS WITH MORE PRECISE POSITIONING AND DYNAMIC RESPONSE CHARACTERISTICS



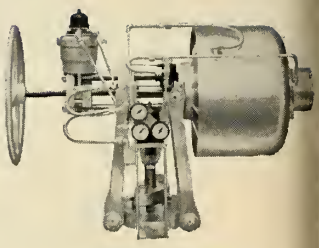
1542 & 1544 SERIES DOMOTOR POWERED ACTUATORS

Two types, "Direct Thrust" (illustrated) or "Lever" units are available for any application requiring accurate positioning in response to a pneumatic signal, such as butterfly valves, dampers, turbines and engine governors. Guaranteed positioning accuracy of better than 0.001" per inch of stroke over the complete range of piston travel is combined with a smooth operating action that provides an accurate, stable output force.



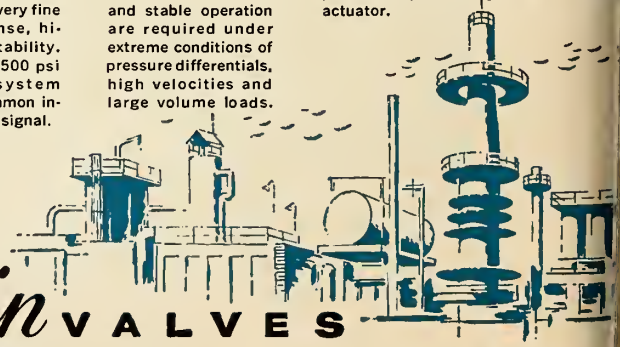
600 SERIES STROKE POSITIONING ACTUATORS

Offered primarily for the control of variable speed drives, rheostats, pumps and cams, as well as control valves, with strokes up to 6 inches and forces up to 2510 pounds of thrust. Compact and rugged, for easy mounting on existing equipment. May be operated from a standard 3-15 psi instrument signal, with a positional accuracy within 0.001" per inch of stroke.



10,000 SERIES PNEUMATIC-HYDRAULIC ACTUATORS

For valves requiring strokes to 6 inches and thrusts to 100,000 lbs. Furnished on body assemblies where process conditions require very fine valve response, hi-speed and stability. Operate on 1500 psi oil supply system from any common instrument air signal.



20,000 SERIES ELECTRO-HYDRAULIC ACTUATORS

Provide a means of converting an electrical signal to a powerful hydraulic positioning force, where high speed of response and stable operation are required under extreme conditions of pressure differentials, high velocities and large volume loads.

TOGGLE ACTUATORS

For process requirements where the unbalanced forces are extremely high, or where large through-puts are required. Three types are offered: pneumatic positioning, pneumatic on-off, and manual control, all embodying the toggle actuator; or a manual control arrangement can be combined with the pneumatic positioning or on-off toggle actuator.

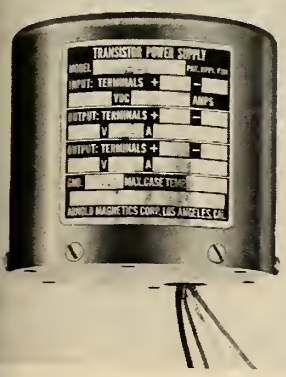
EALED ELECTRIC COUNTER HAS ELECTRIC RESET

Durant Mfg. Co.'s new Model 5-E-9156-ER is a hermetically sealed lectric counter with electric reset, de-gned specifically for use on military nd other applications where adverse perating conditions are a factor. It is anufactured to meet MIL specifica-ons 5272-A and similar rugged ecfications.

Although especially designed for ich military applications as missile round support equipment and aircraft strumentation, Model YE-9156-ER ay also be used on industrial installa-ons where severe atmospheric condi-ons prevail, or where an explosion-roof unit is required.

Provision is made for mounting the unter to the front panel through four 32 threaded holes on the face of the unter. It is also equipped with four ounting lugs at the base for applica-ons where additional support is eeded, or for base installation. Com-ct in size and sturdy in construction, odel 5-YE-9156-ER is complete with Winchester hermatic seal connector



on the bottom for quick connection to the power source.

Case size—3½" wide x 1-7/8" deep x 3-7/16" high. Figures—3/16" high x 9/64" wide. White on black background, with wide window opening for maximum readability. Speeds —1500 CPM or 25 CPS standard, with maximum resetting time of 105 milliseconds. Voltage—28 V. DC—Other voltages available on special order. Finish—Gray color 36492 per federal standard 596 for military panels.

Power Supply Produces DC to Square Wave

Arnold Magnetics Corp. has announced a transistorized power supply that will produce 400 cps single-phase, square wave power from a 28 volt DC line.

Unit delivers 50 VA of output power with a frequency and voltage regulation of ±1% for variations of input voltage of 5 volts. An output power of 115 volts, 400 cycles is standard, but any voltage between 6 or 1200 VRMS, and any frequency between 400 and 2000 cps, is available on request.

Protection against internal damage is provided by the use of an added circuit, which has the effect of rendering the power supply non-operative when the polarity is inadvertently reversed. Unit can withstand short circuit indefinitely, input voltage transients of 60 volts for 0.01 seconds, and 50 volts indefinitely at reduced power. Voltage drift is ±3% across a temperature range of from −55°C to +71°C.

Designated Model 591AC, unit is fully incapsulated and hermetically sealed, and meets the test specifications of MIL-E-5272B. Size is 3" OD x 3-3/16" high, and weight is 22 ounces.

Three standard terminations are available—A/N connector, wire-lead pigtail, and solder-lug terminals.

Fill in No. 114 on Subscriber Service Card.

Pneumatic Hose Has 24,000 Psi Burst Pressure

Aeroquip's Development-Engineering Center offers 678 Hose of Teflon for 6000 psi pneumatic systems and with a 24,000 psi burst pressure. 678 Hose is designed for the more severe requirements of missile pneumatic charging systems. The 4 to 1 safety factor of the hose provides greater safety to crews handling very high pressure air, helium, nitrogen, and other gases.

The hose has a Teflon tube with zero moisture absorption and an anti-adhesive surface to permit fast, easy purging and dehydration of hose lines and equipment. Spirally-wound stainless steel wire overlaying a stainless inner braid reinforces the hose, which has a stainless braided cover. Though constructed for use under rough handling, it retains flexibility making it easy to coil on reels. It is available in in -6 (3/8") and in -8 (½") sizes.

New segmented fittings for 678 Hose are reusable and incorporate a proven lip-seal for permanent leakproof performance. Designed concurrently with the 678 Hose is a lighter weight pneumatic hose for 3500 psi pneumatic systems. Designated 675 Hose, it features a Teflon tube and two-ply stainless steel wire braid reinforcement. With the exception of pressure requirements, it has the same characteristics of the 678 Hose and other Aeroquip Hoses of Teflon. It is available in sizes −4 (¼") to −12 (¾"), and fittings are of the reusable "super gem" type.

Fill in No. 115 on Subscriber Service Card.

FRI Float Switch To Close Circuits

The Flight Refueling, Inc. Model FS-2 Float Switch is ideal for use in any system where it is required to operate electrically actuated valves and

indicator light systems. It can be used for closing a circuit either by the rise or fall of a fluid level. Switches of this type can be used for both ground, aircraft and missile installations with the highest degree of reliability. A variety of float arm configurations are available to suit alternate requirements. Other float switches of this general type are available on special order for varying fluids and for special applications.

Monitoring Equipment Tracks Interference

The Mobile Interference Analysis Station assembled by Missileonics, Inc. of Melbourne, Fla., locate, track down, and record interference; and are able to eliminate any interfering radio signals by coordination with area frequency users. These signals may affect radio control of missile firings, or the telemetry signals from the missile.

The stations monitor radio signals in the frequencies from 1500 kilocycles to 10,000 megacycles. Advanced direction finding and field intensity equipment coupled with the ability of the stations to traverse cross-country roads, afford a quick means of locating the origin of any interfering radio signal. The stations are installed in specially designed truck vans constructed by Gramm Trailer Corp., Lima, O., and mounted on a heavy-duty Ford chassis, fitted with power steering and power brakes. Complete air conditioning and heating equipment are furnished, and independent gasoline-driven generators supply up to 7 KVA for operation of the electronic equipment.

Fill in No. 117 on Subscriber Service Card.

Pipe and Tube Connectors Offer Advantages

Meeting the high pressure, temperature and minimum weight requirements of the aircraft and missiles industry, Flight Refueling Inc.'s complete line of pipe and tube connectors offers many additional advantages. Positive grip and seal under conditions of angular misalignment, parallel axial offset and tube gaps assure a constant connection on beaded or flange type tubing.

One family of connectors provides for easy hand installation in hard-to-get-to places, where wrench movements are prohibited. Connectors are available in sizes from ¾" to 4½".

Fill in No. 118 on Subscriber Service Card.

Low-Cost Standards Used For Ground Support

New low-cost frequency standards which perform well in uncontrolled environments such as found in the operation of military ground support equipment and industrial applications, have been developed by The Gyrex Corp.

Resonant elements of the new Model TQ 60C units operate at their fundamental frequencies. This feature eliminates the need for auxiliary step-down circuitry, giving the instrument exceptionally high reliability. They can be operated or stored over a wide temperature range. Shock, vibration and atmospheric conditions normally found in connection with the operation of ground support equipment will not affect their operation. All units are hermetically sealed and qualify to MIL environment test specifications for ground support equipment.

Other advantages of the new Model TQ 60C units include simple transistorized circuitry and compact size.

Fill in No. 119 on Subscriber Service Card.

Miniature Accelerometer Is Developed

A new accelerometer measuring only 1" x 1" x 1¾" and weighing just three ounces, has been developed by Genisco, Inc., Los Angeles. A potentiometer-type pickoff is used.

The small size and light weight of the new instrument, designated Model GMA, makes it particularly suited for aircraft and missile fire and flight control systems and telemetering applications.

Range of the Model GMA is ± 0.5g to ± 100g's with natural frequencies of from 12 cps to 75 cps. Linearity is ± 1% of full scale for balanced range instruments. Damping is nominally 0.7 of critical at +75°F, provided by the shearing of silicone fluid between closely spaced moving surfaces. The instrument is temperature compensated and will operate to specifications between −20°F and +250°F.

It is able to withstand vibrational accelerations of 10g's, 10 to 20,000 cps, on any axis, and shock accelerations of 50g's for 7 ms duration on any axis.

ersatile Missile Check alve Is Lightweight

Flight Refueling Inc.'s Model CV-1 issile and aircraft check valves are ghtweight, reliable and extremely ver- tile. Standard beaded AND-10060 ype A) ends permit rapid in-line in- allation by using two pipe connectors. the interest of weight reduction,

tese check valves may be incorporated i o any long tube merely by expand- ig a small end section of the tube, tereby eliminating one pipe connector.

These operationally proved valves a positive sealing and feature low "acking" pressure and low pressure op. Design makes it practical for use vh most fluids and gases. The CV-1 is also available with threaded ends for s cial applications.

uminum Shelter Air Transportable

Gramm Trailer Corp. offers shelter o continuous ribs of extruded alumi- nm, located between end panels so e uipment can be supported properly ir any area. Longitudinal members are w ded to rib sections at the four cor- n s. Equipment can also be fastened tc hese members for support. The skid is ntegral with the bottom longitudinal m mbers for strength as well as simpli- ci of design. All inside dimensions are sc are so equipment may be mounted fl h against the wall. The inside may b ined with plywood, sheet aluminum, or perforated metal to suit individual re uirements. Hardware is flush m nted to minimize damage. Dutch d r comes equipped with flush frost b aking hardware as standard equip- m t.

This shelter is air transportable and ca be transported by C-119, or C124, he copter and M-35 truck.

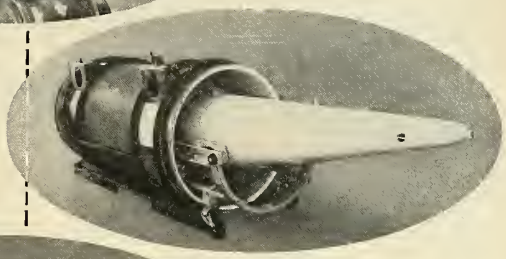
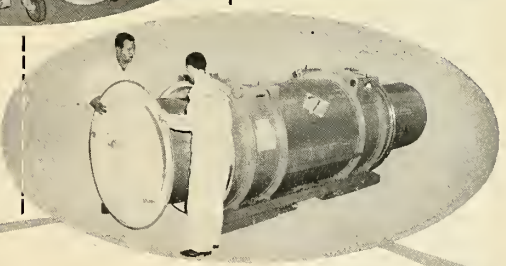
HARCO



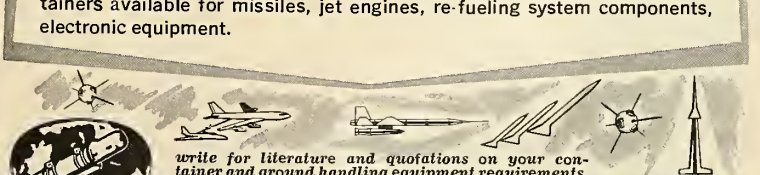
a PROVEN source

OF FIBERGLASS CONTAINERS AND INTEGRAL GROUND HANDLING TRAILERS

LOADED CONTAINERS
Measuring 18½' long, 4½' diameter and weighing up to 4800-pounds when loaded with in-flight refueling stores and integral trailer, can be stacked 3 high to conserve storage space.



FAST UNLOADING OF REFUELING STORES
Less than 60-seconds required to remove end sections, through use of unique Vee-band clamps, greatly speeds unloading of stores on integral ground handling Harco trailer.



TRAILER IN PLACE FOR RETURN TO BASE
Harco Containers are a complete system for storage, transport and ground handling of critical stores; important part of system is Harco developed trailer which is returnable within container for re-loading.

END SECTIONS REVERSED FOR RETURN SHIPMENT
Overall length is reduced by half for empty-return shipment, conserving valuable shipping space. Use of fiberglass reduces container weight by 60%; is impervious to rust or corrosion; easily repaired in the field.

Harco Containers are the **only** fiberglass containers for storage, transport and handling of in-flight refueling stores approved by BuAer. Features include 60% reduction in weight, reversible end sections to cut return shipping size by ½, integral ground handling trailers for stores, 60-second availability of stores through use of quick release Vee-bands on end sections. Two years of field service prove their superiority. Other Harco Containers available for missiles, jet engines, re-fueling system components, electronic equipment.

Our Superiority Here . . .

LAMINUM®
the solid Shim that p-e-e-l-s for adjustment

Our superiority in the production of Laminated Shims of LAMINUM, to the most exacting specifications, results in numerous and profitable advantages. Manufacturers of aircraft, missiles and rockets, of motors and engines, of machine tools and similar precision-assembled equipment save time, cut costs and turn out better products with LAMINUM. Close-tolerance accuracy in fit and alignment is assured...with never a need for grinding counting, stacking nor miking. Laminated Shims of LAMINUM simply p-e-e-l for adjustment, with no dirt between layers—ever!

Brass with laminations of .002" or .003"

Mild Steel with laminations of .002" or .003"

Stainless Steel with laminations of .002" or .003"

Aluminum with laminations of .003" and NEW .002"

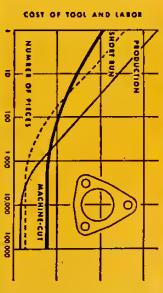
.Guarantees Superiority Here . . .

Actually, our famous Shims of LAMINUM are perfect precision STAMPINGS. Consequently, we have perfected our own special equipment and tooling, our own skills and techniques, unknown to ordinary stampings producers. Result: the unique ability to quickly produce precision STAMPINGS...in any contour, in any size...in any quantity "one to a million"...at the lowest possible unit cost. We have 3 exclusive Methods—pick the one that fits *you* best...

1. FOR A FEW PIECES



t Experimental
Pilot Stage
we use our
ACHINE CUT
ETHOD. No dies
eeded. Our spe-
al equipment,
us our unique
chniques, are
pplied to pro-
ce small quan-
ties at very low
st.

2. FOR SHORT RUNS

—we use our *low-cost*, SHORT RUN TOOLING METHOD. Our low cost tooling and simple dies, plus special presses, go to work to produce something more than "just a few." Quality is high—costs stay low.

3. FOR PRODUCTION RUNS

—we use our PRODUCTION RUN METHOD. Here is where our production tooling applies to great advantage, and when dies are needed, charges are moderate. The chart tells the story...top quality stampings at lowest possible unit cost.

ANY ONE OF THESE 3 METHODS WILL PRODUCE
AIRCRAFT-QUALITY STAMPINGS TO YOUR OWN RIGID STANDARDS

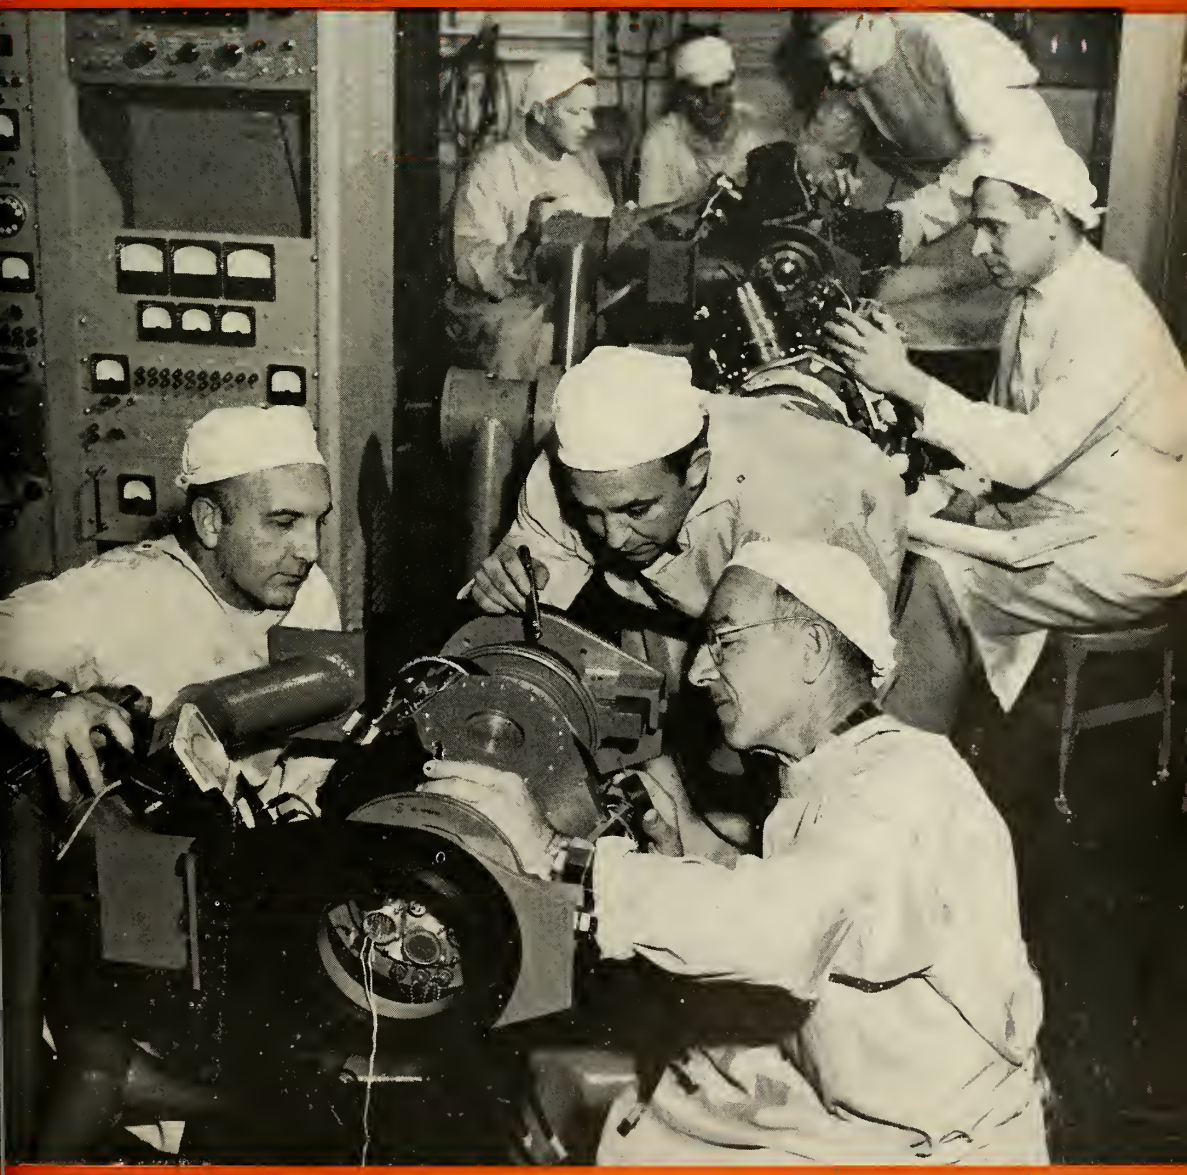
SEAT DETAIL

Relief valve with replaceable O-ring seat

Bubble-tight operation up to set pressure is now possible with Anderson, Greenwood & Co.'s Type 3 Relief Valves. This new design uses replaceable O-ring seats to give perfect sealing and reseating qualities over a long dependable life — even on helium at 7000 psi. Write for catalog 151.



ANDERSON, GREENWOOD & CO.

1400 N. RICE AVE. BELLAIRE, TEXAS

CHECKOUT EQUIPMENT

This equipment determines prior to launching whether all portions of the missile will or will not perform as intended. It is used to check out warhead, guidance, control and propulsion systems.

DESTINATION KNOWN

When a mighty "Thor" blasts off from Vandenberg Air Force Base it is checked out, launched and tracked by Packard Bell's ground support equipment and Missile Impact Prediction System.

ENGINEERING BEYOND THE EXPECTED

The Missile Impact Predictor is one-eighth the size and was built at one-tenth the cost of previous systems. Ground support equipment matches the reliability built into the "Thor." All combine to guarantee an effective weapon for retaliation or space exploration... destination known.

CHART RECORDERS USE ADVANCED COMPONENTS

New circular chart recorder-controllers, with either electric or pneumatic controls, have been introduced by the Daystrom-Weston Industrial Division of Daystrom, Inc.

The new circular chart recorders employ advanced components, such as the division's recently developed D-Pak unit, and other improved mechanisms "to provide greater instrument reliability and service in process industries," according to the company.

All models of the new recorder-controllers feature the revolutionary D-Pak constant voltage supply unit which eliminates batteries, standard cells, and standardizing mechanisms in potentiometers; interchangeable slidewires, easy replaceable range standards, plug-in amplifiers, universal mountings, recessed indicator pointers to facilitate chart replacements; and rigidly supported scales on back of the plate assembly to permit easy calibration and indicator readings with the door open.

Pneumatic controls—in models 6836 potentiometer and 6856 Wheatstone bridge—are available as universal controller, proportional plus automatic reset, or proportional with automatic reset and derivative; proportional band adjustability—2 to 300 per cent. The proportional controller with reset, or reset and derivative, is recommended for more complex processes with high capacity or where appreciable transfer lag and/or dead-time is present.

Optional 4-position pneumatic transfer switch—automatic, manual, test, and service—provides complete control loop flexibility (supply air at 20 psig; controlled air at three to 15 psig). Piping of the "flip switch" also provides true bumpless transfer since gage accuracy is not a governing factor.

Electric controls—in models 6833 potentiometer and 6853 Wheatstone bridge—are available as contact type (two-position or three-position) and

proportioning control with 5, 10, or 20 per cent proportional band.

The control mechanism is directly coupled to the slidewire shaft, eliminating lag and backlash inherent with linkage and cams. According to division engineers, the unusual design of the control mechanism eliminates chatter due to vibration with even the narrowest differential and, being completely enclosed, insures long trouble-free performance under adverse atmospheric conditions.

The new null-balancing type circular chart recorders are designed for a-c operation only; 115 volts, 60 cycles; or 115 volts, 50 cycles as specified; accuracy of plus or minus 0.25 per cent of span, or .025 mv. Design features include 12-inch chart with full scale pen travel of 4-5/8 inches; 33.86-inch long, 320° concentric scale; large easily read numerals; many standard calibration ranges for potentiometer or Wheatstone bridge; full-scale response time of 5, 10, and 20 seconds; enclosed connection terminals; and standard chart speeds.

heta Instrument Makes ystem Error Bridge

With the Theta-Bridge the angular position of any synchro or resolver inaccessibly located within a complex system can be directly measured without any mechanical coupling. The only connection is via the electrical leads of the synchro or resolver. Loading of the system is avoided through use of very high impedance elements in Theta Instrument Corp.'s new device. It is also used to simulate a perfect synchro or resolver input to a system. Three dials display angular position digitally to three decimal places over a 360° range. The initial calibration to a particular system is accomplished without the necessity for mechanical rotation of any part of the system, and without the necessity for adjusting the system voltage excitation to an accurate level. Specifications: Accuracy, 10 sec. of arc. Readability, .001°. Size, 19 in. wide by 10½ in. high by 8 in. deep.

New Five-Channel Timer Has Low Contact Bounce

An extremely accurate, fixed position Interval Timer which limits contact bounce to within a range of 50 to 300 microseconds has been developed by Western Design & Manufacturing Corp., Santa Barbara, California, a division of U. S. Industries, Inc.

Currently utilized by two major aircraft companies in aircraft and missile systems checkout under severe environmental conditions, this compact electromechanical device is designed to provide highly accurate switching operations at precise time intervals for electrical circuits. Timing cycles may be as short as a second or as long as several hours.

With up to five independent channels available in the standard unit, events may be sequenced simultaneously or in a series, or in a combination of both. On special order, the number of channels may be increased to 10 as the synchronous motor has ample torque to handle the increased operating load.

The Western Design Timer, in addition to the synchronous motor, consists of a unique cam and positive action contact arrangement in which one set of contacts makes the circuit and the other set breaks the circuit. This action sharply defines the start or finish of any pulse and is accomplished by the use of abrupt discontinuities on the cam surfaces which permit the tripping points to be set precisely. The speed of contact operation is independent of the speed of rotation of the cams.

This unique design reduces duration of contact bounce to an absolute minimum. Total contact bounce on the circuit make and break is so slight it can be measured in microseconds, less than 300 microseconds on make, and less than 50 microseconds on break in production line units.

Contacts are designed for a load current of at least 0.5 amperes and are capable of operating satisfactorily with higher currents depending on the type of circuits and duty cycle required.

Because of the synchronous drive motors, the tolerance of the timing pulses is held to ±1/5 of one percent or ±10 milliseconds whichever is greater. These tolerances are relative to a 60 cycle or 400 cycle time base accuracy.

A variable speed drive may be used so that one channel of the output pulses of the timer may be fed back into a closed loop servo system which will automatically synchronize the timer function with an external process.

The Interval Timer is supplied to operate at various input voltages on 60 cps and 400 cps alternating current lines or on direct current. Diminutive in size, the units are 5 inches long, with a 2.2 inch diameter and weigh as little as 1.5 lbs.

Transistorized Tachometer Goes on Market

To fill the need in industry for a moderately priced indicating instrument suitable for numerous applications, Kahn and Co. has developed and put on the market their Transi-Tach Transistorized Tachometer.

The Transi-Tach is available in three basic models—for 19″ rack panel mounting, as a portable unit, or with remote indicator. All models are self-powered by a 9-volt battery, but can also be used with 115 volts, 60 cycle AC.

The Transi-Tach indicates the speed of rotating shafts through the use of a magnetic or other speed pickup. RPM is read directly on a large meter scale which can be calibrated in any speed range desired with as many as 120 linear scale divisions. Speeds up to 60,000 rpm can be accurately measured. Zero suppression can be built into the scale to enable scale expansion within a desired speed range.

Since it is essentially a frequency meter, the Transi-Tach can be supplied as such for the measurement of audio or ultrasonic frequencies. It may also be adapted for use in conjunction with any transducer which converts flows, pressures or other physical forces into electrical signals of variable frequencies. Accuracy is plus or minus 2% of full scale of the meter reading. The proper transducer for each application can be supplied by Kahn and Company. Complete information is contained in illustrated bulletin which is available from Kahn and Company, Inc.

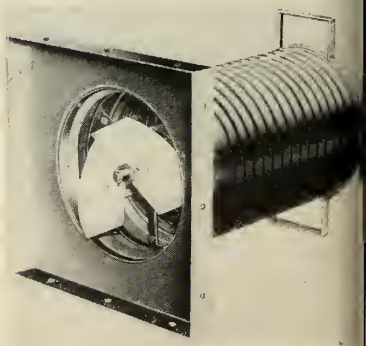
Manometer Model TA Has 25 Tubes

Dynametrics Model TA Tiltable Manometer, Dynametrics Corp., is designed for operation as either a standard vertical manometer or a slant tube manometer at any selected angle from 11° to 90°. This mobile, backlighted unit has 25 tubes mounted in a rigid box frame. The frame is balanced in precision line-bored pivots on the mobile stand, and has a manual-locking adjustment to fix the frame at any desired angle between vertical and 11° of horizontal. Slanting the bank increases the sensitivity of fluid height indication over smaller ranges and permits a more accurate pressure measurement. Zero register is accurate on all tubes even at the greatest tilt angle. When used as a standard vertical unit, the Model TA retains all the favorable characteristics of the Dynametrics multibank and multitube manometers.



All tubes are manifolded to a single, manually adjustable reservoir. A vernier is provided for fine adjustment at angles near the horizontal. To reduce the quantity of fluid necessary, the pyrex tubes have a smaller than standard bore. The accurate co-planar scale sheet is backlighted for photography and is graduated in inches and tenths of inches. The stand is mounted on 4 swivel casters for mobility and has built-in leveling jacks and level indicator for precise set up after locating.

As in all other Dynametrics manometers, the Model TA can be equipped, at slight extra cost, with a metric scale, check valves, or other standard accessories. One model of this unit is standard: TA-25-60 (25 tubes 60″ scale height).

Sun Electric Improves Electric Power Absorber

An improved version of their versatile Electric Power Absorber is announced by Sun Electric Corporation. The unit is used extensively in aircraft and missile testing systems applications. It is compact and has a low weight factor in relation to power absorbtion and heat dissipation. 10 to 15 KW capacity is claimed for AC use and up to 450 amperes at 30 volts DC.

New features include a front mounting panel for stacking units to conserve space. Mounting panel is one 13 inches square, overall length approximately 18 inches and weight 15 to 20 pounds depending on capacity.

A low temperature coefficient resistance ribbon within a slotted housing is cooled by ambient air drawn through a cooling tube by an internal mounted fan and motor. The motor may be operated as a part of the load or from an independent power source.

The unit is easily wired and is fully protected against overload. Infinite variable loading within the range of each unit can be achieved by the addition of a carbon pile or similar variable resistor.

ELECTRO SNAP

Creators of over 6,000 Precision Switches and Controls

presents . . .

A new panel concept that promises to revolutionize monitoring or control of Missiles and Rockets

the astromatic panel concept

"THE MOST EFFICIENT LINK BETWEEN MIND AND MACHINES"

Consider These Obvious Advantages in Your Designing

- ★ OFFERS INSTANT VISUAL CONTROL WITH EXTREME ACCURACY
- ★ REDUCES HUMAN ERROR TO AN IMPROBABILITY
- ★ PROVIDES SIMPLIFICATION OF THE MOST COMPLEX OPERATION
- ★ ALLOWS REMARKABLE CONSERVATION OF VITAL SPACE
- ★ WITHSTANDS EXTREME LIMITS OF TESTING SPECIFICATIONS
- ★ APPLICATION POSSIBILITIES AS UNLIMITED AS THE IMAGINATION

Study the following specifications with your project in mind . . . .

ASTROMATIC DIVISION
Electrosnap Corporation
4218 West Lake Street, Chicago 24, Illinois

the astromatic panel concept by ELECTROSNAP

Ready now for tomorrow's higher control requirements

This new concept in panel techniques combines the latest advances in scientific, technological and psychological achievements to insure the highest possible degree of efficiency and accuracy in control or monitoring of equipment.

HUMAN FACTOR ENGINEERED for highest efficiency with extreme accuracy

100% FLUSH PANEL . . . Eliminates protruding hardware . . . unless specified by human engineering requirements. Switching functions may be recessed, flush, or over-flush.

TRI-COLOR LIGHTS . . . Each light module contains 3 separate bulbs and circuits to permit triple indications such as GO, NO-GO and CAUTION signalling.

CONCENTRATED GROUPING OF CONTROLS . . . Multiple function of TRI-LITE controls permits high component density, saving from two to four times space required by ordinary panel. Permits instant visual recognition and action by operator, minimizing time-loss found in larger panels.

VERSATILE SWITCHING . . . The switching and indicating techniques are specifically designed for maximum compatibility with this advanced panel. Momentary, positive feel and alternate action switching is available.

LIMITLESS COLOR COMBINATIONS . . . The unique combination of TRILITES plus multi-color photo printing of panel allows unlimited color guidance, distinctly identifiable even by color blind.

SCHEMATIC DIAGRAMMING . . . Photo color printing of panel surface permits visual schematic diagramming. Increases speed and efficiency of operators and recognition of system indications. Reduces indoctrination period for operator training. Eliminates the written word.

PRECISION ENGINEERED

. . . Meets or exceeds most exacting specifications

SHOCK AND ABUSE TOLERANT . . . Laminated Fiberglas panel resists chipping, shattering, crazing. Coefficient of expansion identical to aluminum sub-assemblies eliminates buckling under stress or extreme cold or heat conditions.

LASTING LEGIBILITY . . . Exclusive process imbues color into Fiberglas . . . resists wear-off of legend and diagramming. Vivid colors actually photoprinted—will not chip or scratch off. Meets all requirements of MIL-P-7788 for Aircraft Cockpit Panel.

QUICK LAMP REPLACEMENT . . . Front panel hinged for quick access to components below, permitting 10-second bulb change if necessary.

EASY TO ALTER . . . During prototyping legend and schematic diagramming can be easily changed to visualize any new findings. Components under panel may be relocated.

VERSATILITY OF DESIGN . . . The module concept of construction makes the Astromatic panel technique extremely versatile. WHATEVER ACTION YOU DESIRE TO VISUALIZE, ASTROMATIC CAN SUBMIT A PANEL DESIGN TO SURPASS YOUR EXPECTATIONS.

LOOK TO HAWS FOR SAFETY

EYE WASH / EYE-FACE WASH / DRENCH SHOWER

Only HAWS provides a complete line of eye-wash and drench shower units — performance-proven models to serve virtually any industrial and laboratory need! Instant water irrigation washes harmful irritants from exposed areas for immediate first aid before medical help arrives — or as a routine precautionary measure. HAWS will supply the equipment that best fits your operation!

Model 8600: Fiberglass Decontamination Booth; Model 8930: Basic eye-wash fountain; Model 8950: Portable eye-wash fountain; Model 8933: Basic eye- and face-wash fountain; Model 8650: Walk-through decontamination shower; Model 8935: Drench shower with eye-wash combination.

Balcrank counter balanced

Best quality, fine grain cast iron.
Rim and handles polished to high luster.
Center hole and hub faces true with rim,
all to close tolerances to eliminate wobble.

HAND WHEELS

Handles are revolving, solid or omitted. Available in standard sizes 4" to 12" dia. with plating, broaching or other machining to your specification.

machine HANDLES

Revolving handles turn on HARDENED steel spindle with permanent graphite grease lubrication permitting FASTER, EASIER adjustment by user. Machined from quality BAR STEEL ground and POLISHED to a smooth, high luster. Soft shank ends for assembly. Wide range of standard sizes in both revolving and solid types.

Furnace Braze Stainless Alloys

To eliminate problems of distortion, stress, oxidation, and porous welds

The advantages of stainless alloy brazing in dry hydrogen or vacuum environment furnaces are many. And the use of brazing for high-temperature service parts is growing just as fast as potential users learn to design for it. We offer technical design assistance to further the acceptance of this modern joining technique. Ten years of pioneering this field, plus operating three stainless processing plants, plus manufacturing our own Nicrobraz® brazing alloys, fully qualifies us to give initial guidance to your design crew in planning brazed stainless components. Call TWinbrook 3-3800 in Detroit, or write to find out how we might help you.

NUCLEAR EXPLOSIONS IN SPACE

by Prof. S. Fred Singer

the story behind
Project ARGUS

Reprints of this exclusive M/R report are now available due to repeated requests.

A series of four illustrated articles combined, this important M/R special contains scientific explanations of:

* **project ARGUS**
* **creation of an artificial particle belt**
* **effect on manned space vehicles and nuclear warheads**
* **effects on radar and long-range communications**
* **scientific techniques for detecting such explosions**

50 cents per copy

missiles and rockets
1001 Vermont Ave., N.W.
Washington, D.C.

GUIDANCE EQUIPMENT

Guidance equipment (electronic, inertial, optical) determines where the missile is relative to where it should be in order to hit its target, and subsequently issues corrective instructions to the missile control system. Guidance equipment also includes the control system that makes the missile change its direction of flight: the fins, hydraulic, electrical or mechanical circuitries, actuators, jetavators, jets, and so on.

ELECTRO-MECHANICAL AND ELECTRONIC TIMING DEVICES

REPEAT CYCLE TIMERS

— 3″ long (Typical)
— 6½ ounces basic
— 1-8 switches (Standard)
— Cycle Time 5 sec. to 90 Min.
— Loads to 5 Amperes

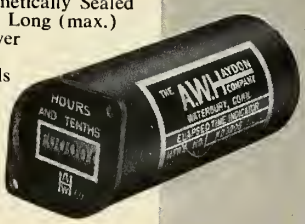
Write for Bulletin AWH RC-301

SUB-MINIATURE ELECTRO-MECHANICAL TIMING DEVICES

Features
Hermetically Sealed Housings
¼ Size
— ½ Weight of Standard Designs
1 x 2 Cross-Section
DC, 60 or 400 CPS
Meet MIL-E-5272A

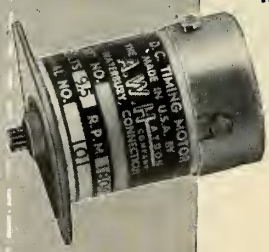
TIME DELAY RELAY

— 3″ long (Typica
— 7½ ounces bas
— 1-3 switches (Standard
— Time Dela
— 25 Sec. to 3 Hou
— Loads to 5 Amper



Write for Bulle AWH TD-5

ELAPSED TIME INDICATORS



— Sub-Miniature — Hermetically Sealed
— 1¼″ Diameter — 2⅞″ Long (max.)
— 3 Watts maximum power
— Digital or Dial Type
— 60 cps & 400 cps models cataloged
— DC Models Available
— Meet MIL-E-5272A MIL-M-7793B

Write for Bulletin AWH ET-602 describes 400 cps models
AWH ET-603 describes 60 cps models

MINIATURE TIMING MOTOR

— Compact — High Performan
— 60 or 400 Cycle A
— 15/16″ Diameter — 1 7/32″ lo
— Direct Curre
— 13/16″ Diameter — 1 11/32″ lo
— Submit problem stateme with motor requirements f recommendatio

ELECTRONIC TIME DELAY RELAYS

Miniature Series

— 1 7/16″ x 1 21/32″ x 2½″ long
— 1-4 SPDT contacts
— Loads to 10 Amperes
— Weight — only 6 ounces
— 5½ Watts maximum power

Write for Bulletin AWH TD-503

Features
Hermetically Sealed Housings
Variety of Circuits
Temperature to 250°F
Vibration to 2000 cps, 15 g
Meet MIL-E-5272A
Unique Transistorized RC Time Constant network
Time Delays 50 MS to 120 sec.

Sub-Miniature Serie

— 31/32″ x 1 3/1 x 2″ long (max
— 1-2 SPDT contac
— Loads to 8 Amper
— Weight only 3 ounc
— 4 Watts maximum pow

Write for Bulle AWH TD-5

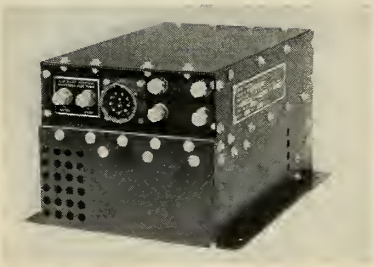
New Products

• *guidance equipment*

AGNETIC AMPLIFIER IS SMALL UNIT



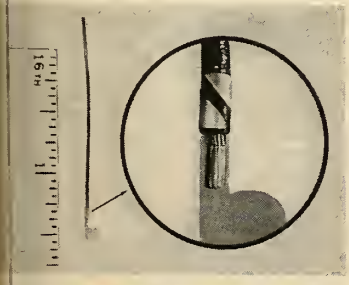
A new Variable Output Magnetic mplifier for aircraft and missile use as been developed by the Vap-Air eronautical Products Division of apor Heating Corporation, Chicago, . It is said to be the smallest in size d weight of any unit of this type ailable. It has an output of from to 2000 watts.

The Variable Output Magnetic Amifier can be used in many aircraft d missile systems including windield temperature control, heater conol, and motor speed control.

The advantage of the Variable Outt Magnetic Amplifier over the on- type is the modulating output, minating power surges in the airaft or missile electrical system.

It also replaces three units normally ed in a system; the temperature ntroller, power contactor, and the nsformer.

Combining the functions of these its into a single control eliminates, extra AN Connectors and harness tie them together, 2) moving elecal contacts in the control box and ntactor, and 3) installing three units.



The controller also offers fail-safe features which will shut the controller off in the event of loss of power, pick-up short, or pickup open.

In addition, the Variable Output Magnetic Amplifier has the ruggedness which is characteristic of mag-amps. The unit meets the requirements of MIL-E-5272A, is adjustable over a wide range, has the built-in reliability which mag-amps offer, and features extreme accuracy and repeatability of operation in ambients of minus 65° to 200°F.

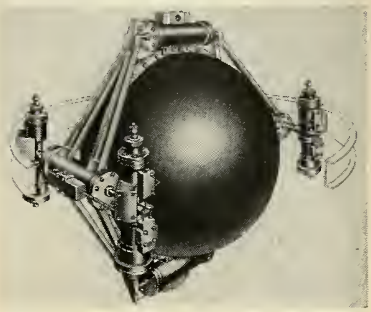
iniature Terminals Are esistant Welded

A new process has been developed b Manger Electric Co. to meet the t minating requirements of subminiae electronic assemblies. No longer ited to ready made terminals, terations can now be designed to fit assembly. These terminals can be surely welded to wire as small as W.G. #32.

Close tolerances are maintained and h flex life is assured. Engineering se ice is available to assist with any sp ial terminating problems relating to all types of electrical terminations.

l in No. 130 on Subscriber Service Cord.

Mouse Tails Eliminate Clamps



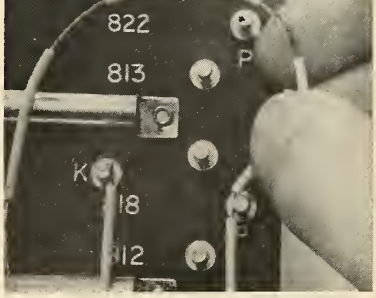
The electronic package for Boeing Airplane Co.'s IM-99 *Bomarc* interceptor missile utilizes a recently-developed "mouse tail" for securing wire bundles to the chassis. These "mouse tails" produced by Rubber Teck, Inc., are made of a tough rubber compound. They are available in lengths from 1 to 4 inches, and are tapered at each end. They are installed easily by passing one tapered end through a hole in the chassis, looping the shank over the wire bundle and inserting the other tapered end through an adjacent hole. When clinched up tight and the tension relieved, expansion of the rubber holds the "mouse tail" firmly in place.

A series of laboratory shake tests has proved that these "mouse tails" will hold firm under all environmental conditions expected during the missile's flight. Use of mouse tails eliminates the need for clamps or waxed string ties. As a result, both weight and a considerable amount of manufacturing time are saved. Rubber Teck has been chosen to be the licensee for their manufacture.

Fill in No. 131 on Subscriber Service Cord.

Isolation System Protects Delicate Units

Walter Kidde & Co., Inc.'s pneumatic vibration isolation system protects delicate units such as missile controls, aircraft components, and sled test instrumentation subjected to large and rapid "g" load changes. The isolation system accomplishes this by maintaining its desired low natural frequency while limiting relative displacement at various load conditions. The system consists of three independent sets of servo-controlled gas springs, each set absorbing a component of the vibrational and acceleration loadings along one of three mutually perpendicular axes.



Fill in No. 132 on Subscriber Service Cord.

Centerstripped Leads Permit Fast Assembly

Manger Electric Co. offers centerstripping as one of its custom wire processing services. The firm has developed equipment which removes the insulation from stranded or solid conductors of any gauge.

The stripped portion may be any length from a minimum of 1/8" and may be located at either regular or irregular intervals throughout the length of the wire. Leads can be cut, end-stripped, and counter-stripped as required, or they can be supplied in a continuous coil.

Centerstripping is of particular interest to manufacturers of products where multiple banks of electrical components have common terminating points. One continuous centerstripped wire can be used in place of two or more single leads.

Fill in No. 133 on Subscriber Service Cord.

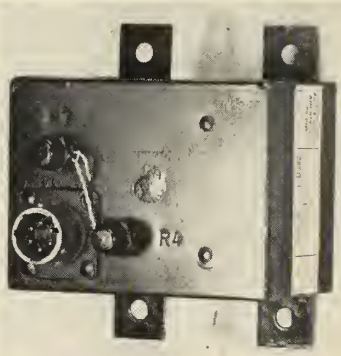
Circuit Breaker Weighs Only 2.1 Oz.

A hermetically-sealed circuit breaker of less than matchbox size has been developed by Heinemann Electric Co. of Trenton, New Jersey.

Called Model SM3, it is the first of Heinemann's SM series of sub-miniature breakers to go into production. The SM series is aimed at applications where small size and light weight are demanded, and where stable performance under varying conditions of shock, vibration, and ambient temperature is vital.

A series-overload breaker, the SM3 is designed for operation at 110 volts at either 60 or 400 cycles, or for 50 volts DC. It is available in ratings from 50 milliamps to 10 amperes. A choice of two time delay curves is offered, for fast or slow overload response, and the breaker is also available with instantaneous-trip response.

Since the SM3 combines magnetic actuation with hydraulic time delay, its current capacity and must-trip points are free from ambient temperature



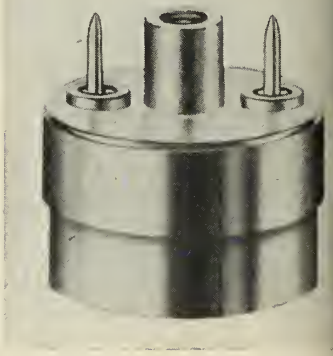
effects. The breaker will maintain its 125-percent must-trip point from –65° to +125° Centigrade. No de-rating is necessary for temperature or vibration. The rugged, hermetically sealed construction assures dependable operation under severe environmental conditions.

Fill in No. 134 on Subscriber Service Card.

Magnetic Amplifier Is New On-Off Type

Vap-Air Division, Vapor Heating Corp., offers a new On-Off Type Magnetic Amplifier Controller that is claimed to be the smallest and lightest unit of its type on the market today. Encapsulated in epoxy, it can stand extreme shock and vibration, yet is smaller than a pack of cigarettes.

The controller has many applications in the aircraft and missile field, among them, windshield temperature control, heater control and overheat warning.



Ruggedness and reliability are characteristics of magnetic amplifiers. Other features of this unit are adjustability ± 25°F. of control point, accuracy, and repeatability of operation in ambients of minus 65° to 200°F. The amplifier meets requirements of MIL-E-5272A.

There are several built-in-fail-safe features which will shut the unit off in case of 1) loss of power, 2) partial or full pickup short, and 3) pickup open.

Fill in No. 135 on Subscriber Service Card.

Bimetal Thermal Switch Weighs ½ Ounce

Weighing ½ ounce, Control Products, Inc.'s "Button" switch is a high-temperature bimetal thermal switch which can be supplied with contacts for either close-on-rise or close-on-fall in temperature. The switch can be supplied calibrated at a maximum of 600°F or down to a minimum of –20°F with a possible close temperature tolerance of 2°F under laboratory conditions. Temperature differential and repeatability for a given switch is about 1°F. An overshoot to 800°F or undershoot to –100°F can be tolerated.

The switch can be mounted by lugs soft soldered directly to, or recessed into the surface to be controlled, thus giving precise surface temperature measurement for applications such as aircraft and airborne electric equipment. It is available with single-wire or two-wire construction.

Hermetically sealed (metal-to-glass) it will meet the shock and vibration requirements of MIL-E-5272A Procedure I. The lower portion of the switch is ¾" in diameter and the upper portion is 25/32" to permit seating the unit in a recessed mounting. The overall height is ¾" including the glass seals and bushing.

Fill in No. 136 on Subscriber Service Card.

Price Electric Improves Crystal-Can Style Relay

Price Electric Corp., Frederick, Md. has announced a design improvement in its Style 6 Crystal-Can-size relay to improve reliability. An internal bracket has been added to support the relay mechanism and position it relative to the header, reinforcing the can in this function.

This design change has not affected the basic simplicity of the design, which does not require an armature hinge pin and thus eliminates the need for precision fitting of the armature hinge. The new bracket is said to improve uniformity and reliability of performance in vibration, shock, contact life and other environmental exposures.

CUSTOM EXTRUSIONS
ROLL-FORMED SHAPES
AND SECONDARY OPERATIONS

WERNER Aluminum plays a vital role in the production efficiency and sales success of such industries as: aircraft—appliances—curtain walls—electrical fixtures—furniture—railway coaches—storm doors and windows—sliding door hardware—trailers—trucks—buses—TV antenna tubing and masts.

WERNER extrusion and roll-forming services cover all alloys including the High Duty alloys, RR57, RR58 and RR257.

WERNER equipment includes heat-treating and fabricating facilities as well as other secondary operations such as punching, drilling, riveting, cutting, bending, welding. Every manufacturing phase from coil or billet to finished part can be performed in our own plant.

WERNER quality controls guarantee exact conformance to critical dimension requirements and design specifications.

WERNER experience, skill and versatility assure prompt delivery to meet production schedules.

WERNER *also manufactures a full line of UL approved aluminum stairway, span and bridge scaffolds — stages — launching towers — ladders.*

from *PROPELLEX*

A NEW SOURCE OF FLIGHT TESTED COMPONENTS

Whatever you need in the way of propellants, explosives and cartridge actuated devices, Propellex can deliver in a minimum of time at a minimum of cost.

PROPELLEX

CHEMICAL CORPORATION
P. O. BOX 187 • EDWARDSVILLE, ILLINOIS
PHONE: EDWARDSVILLE 3400

serving as prime contractor to the U. S. Government and to the nation's aircraft and missile manufacturers.

Engineers and scientists with vision and ability are invited to investigate the opportunities at Propellex.

PROPELLEX

Write today for free booklet describing our facilities, "This is Propellex".

TEMPERATURE TRANSDUCERS

The newest line of Arnoux temperature transducers—100-ohm resistance, 200-millisecond response—permits accurate measurement of transient temperatures such as those in missile and aircraft applications. The output signal is 0-5 vdc for as small a span as 180 F, when Arnoux transistorized TME-1 or TME-2 systems or similar equipment is used.

The fluid-immersion transducer (4101L-11), for static or moving fluid, is LOX compatible and available in two calibration ranges: —302 F to —285 F, —320 F to + 500 F.

The air transducer (4101H-10) is for static to high-velocity gases.

The surface transducer (2101H-15) is for materials of limited area and thickness, and has great mounting versatility.

Both air and surface types are available in two calibration ranges: —100 F to +500 F, —100 F to +1200 F.

Other Specifications:

Calibration accuracy: 0.1-1.0%, depending on temperature range

Repeatability and hysteresis: within calibration accuracy

Resistance at 32 F: 100 ±5 ohms

Nominal temperature-resistance coefficient: 0.0018/°C

Output: 0-5 vdc, when Arnoux 100-ohm TME is used.

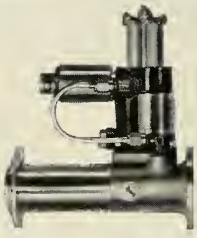
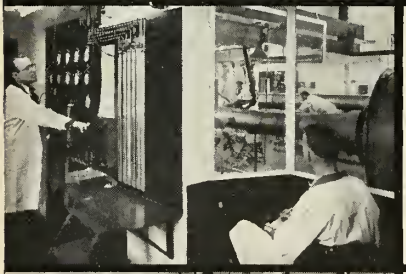
TEST EQUIPMENT

This includes everything in missile testing, ranging from checkout equipment through static test stands, launching pads and flight simulators.

proved | reliable



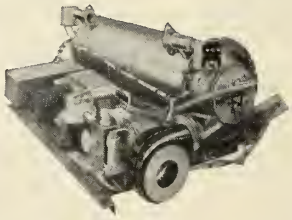
duct couplings / duct supports



Couplings provide metal-to-metal seal, fast disconnects, for high pressure, high temperature air ducts. Standard diameters 1″ to 7″, specials to 36″. Separate or integral duct supports. Many materials.

pneumatic controls

Multi-function weight-saving air valves and regulators manufactured to missile tolerances. Adequate staff for fast design and production changes.



Platular heat exchangers*

Combine efficiency of plates with strength of tubes into new economical modular design. Can fit into cramped, odd-shaped spaces in missiles and high performance aircraft for great variety of applications.

**Trademark of Surface Combustion Corporation.*

ground support liquid heaters

Standard units for vehicle, space, and fuel transfer applications. Available in capacities from 90,000 to 1,000,000 Btu/hour and can be combined easily for greater output. Now in service in a wide range of ground support equipment.

Janitrol development and test facilities provide proof in advance of reliable performance in service.

Contact your Janitrol representatives when you need components or systems for heat transfer or air control. Janitrol Aircraft Division, Surface Combustion Corporation, Columbus 4, Ohio.

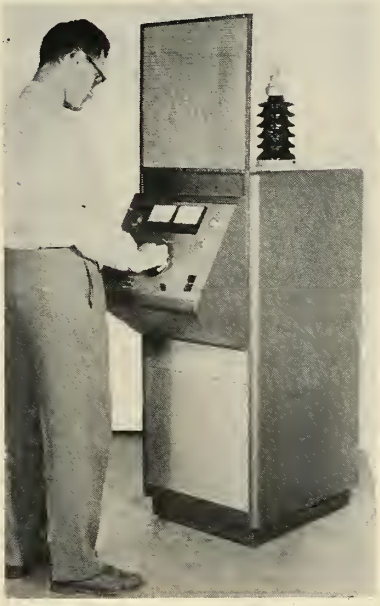
IGH VOLTAGE TEST SETS BECOME AVAILABLE

Testing of high voltage electronic tes, cables and bushings, as well as t dielectric strength of all insulating nterials to ASTM standards is per- f med with the new super-duty line of HYPOT® high voltage test sets, an- nunced by Associated Research, Inc.

The new Series 5700 DC HYPOT® nodels provide facilities for non-de- structive proof testing of high voltage ectronic equipment during production a well as at final inspection. They also net the needs of preventive mainte- nance inspection of high voltage elec- tronic gear, since they are readily port- a e.



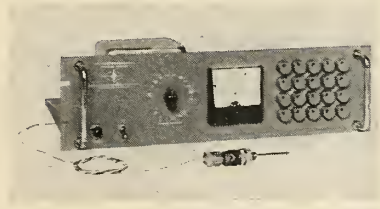
The new super-duty models are hused in a single caster-mounted floor cbinet which affords more convenient oeration and greater safety than do tv-unit high voltage test sets.

All controls are located on the wist high panel which is sloped for ey reading. Two 4½" meters on the pael indicate output voltage and leak- a current.

Many important safety features are irorporated, including the zero-reset h h voltage interlock, quick acting o rload breaker, and a safety screen b ween the operator and the high volt- a output bushing.

A new "Amplivolt" power supply is irorporated in these models, having th selenium rectifiers, capacitors, and k voltmeter multipliers sealed in an o filled tank.

The output test potential is continu- ously variable from zero to maximum an indicated by metering directly in th final output.



Effects of corona, surface and phase leakage are eliminated by an advanced by-pass return (guard) metering circuit, allowing accurate reading of small leakage currents.

A bulletin describing these new super-duty models, as well as the complete line of AC and DC HYPOT® High Voltage Test Sets is available by request.

Fill in No. 138 on Subscriber Service Card.

Uni-Temp Has Greater Range and Accuracy

Increased operating ranges and greater accuracy are specified for resistance temperature measurement systems and components released by the Cardinal Instrumentation Corp. Marked under the trade name of "UNI-TEMP," the new lines are designed on a "building block" principle which makes it possible to purchase either individual components or completely packaged systems.

UNI-TEMP systems cover the entire range of –320°F to +2000°F utilizing resistance temperature transducers. Maximum sensitivity is achieved through the material property of Balco and Platinum resistance wires which display high temperature coefficients and excellent linearity characteristics. Resistance variations as a function of temperature, are changed into voltage variations by UNI-TEMP bridges and power supplies. This provides a full 5 volt output for direct reading on the UNI-TEMP readout module or as input to any standard recording, telemetering or readout device.

The new Cardinal systems require no amplifiers, reference junctions or special shielding—they eliminate the grounding problems inherent in thermoelectric assemblies. System accuracies are available up to ±0.1°F with LOX compatible platinum transducers and up to ±3/4°F with Balco transducers including high pressure applications.

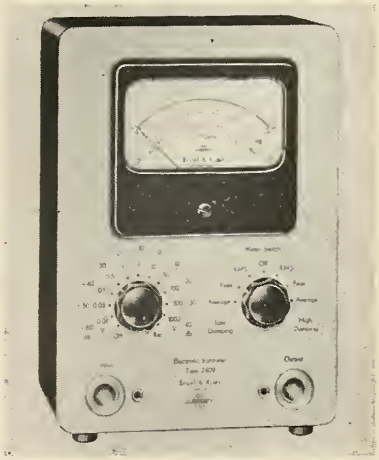
New Dynamometer Model Checks Gyro Motors

The Eder Engineering Co.'s Model 3366 Gyro Wheel Motor Dynamometer for checking the parameters of gyro wheel motors, is used for determining the characteristics for development purposes, and for production testing stators and/or hysteresis rings. The dynamometer measures stall torques and synchronous pullout torques.

For the synchronous pullout test (torque), the hysteresis ring is rotated at 100 RPM less than sync speed of the rotating electrical field of the stator.



Model 3366 Dynamometer comes in several torque ranges from 0-10,000 to 0-100,000 dyne cm ±2%. Other torque ranges are available.

The drive motor for the rotor or hysteresis ring can be obtained with almost any desired RPM. Model 3366 has the following RPM: 1200 ±12, 7800 ±50, 11,900 ±50, 15,900 ±50.

Fill in No. 140 on Subscriber Service Card.

Electronic Voltmeter Reads True RMS

The Bruel & Kjaer Model 2409 Electronic Voltmeter measures either the True RMS, peak or average values of voltages over the frequency range from 2 to 200,000 c/s. An accuracy of 0.5 db is obtained for RMS indication of signals with crest factors up to 5.

According to B & K Instruments, Inc., the Model 2409 may serve as a VTVM with full scale sensitivities of 10 MV to 1,000 V or as a calibrated decade amplifier with 60 db gain.

TRACKING AND TELEMETERING EQUIPMENT

These devices (optical, electronic, or both) follow a missile in flight and report on how it is actually functioning internally. This equipment includes telemetry, radio, radar and optical devices.

The catalog sheets shown here are descriptive of HOBART power supplies available to aviation and avionics industries!

Only at HOBART... can you get such a wide range of units to meet any type of ground power requirement.

Hobart machines are available to match the new requirements of today's aircraft, whether 400 cycle a.c., 28 or 112 volt d.c. In addition to the airlines and corporate users, airframe, powerplant, component part, helicopter and guided-missile manufacturers look to Hobart to meet their power supply needs.

It will pay to look into this! You can get your operations under way sooner and keep costs down when you use Hobart power supplies. 50 to 1500 amperes are available with wide continuously adjustable 26 to 31 volt range for either reciprocating or jet engine starting and testing. For the new jet aircraft and missile check-out and launching there are in the Hobart line, 400 cycle generators in capacities ranging from 3.75 to 125 KVA. This equipment is available in electric motor or engine driven designs and in the type of mounting you need. In other words, no matter what kind of equipment you're looking for, you can get it at one source—Hobart!

The company planning ahead in the fast-moving aviation field will do well to check into Hobart Power Supplies. Your inquiry will promptly bring complete literature and information on the equipment of interest to you. WRITE, PHONE, or WIRE today!

MUFFIN FAN COOLS ELECTRONIC EQUIPMENT

Rotron Mfg. Co. Inc.'s Muffin is logical choice for a wide cross section of cooling projects. Typical applications would include: electronic Black boxes"—transmitters, receivers, adar, etc.; microwave-link equipment; ower supplies—rectifiers, converters, attery chargers, etc.; machine tools—lectronic control enclosures, speed hangers, clutches; light projectors—ide and filmstrip, contour projection; st equipment, instruments; industrial aintenance equipment.

Muffin Fan provides efficient forced ir cooling for projects where cooling as hitherto prohibitive. It is an riginal aerodynamic design with a igh air performance of 100 CFM hile developing sufficient pressure for peration through a dust filter and ghtly packed electronic equipment. uffin Fan is available in three versons: Skeleton Fan; A whirling proeller with 4 mounting arms is what sults from using the "guts" only of e Muffin Fan. It can be mounted s an air-stirring device among hot mponents or can be mounted in the uipment enclosure; Venturi Fan, and rilled Fan.

The Muffin Fan features an inside-ut motor with cantilevered bearings nd with the air impeller integral with e rotor. This shaded-pole motor aws only 13 watts. No capacitor is quired nor are there any commutors, slip rings or brushes which uld shorten life or threaten reliility. No oiling or maintenance of y kind is necessary throughout the e of the fan. Due to the inside-out, ntilevered design the grease does not emically deteriorate nor is there a ed for a large grease reservoir.

A permanent, solid electrical conction is made to two solder terminals quiring just a few seconds time. The

solder terminals eliminate the possibility of lead wires being damaged in shipment, in handling or at the time of final installation—a common source of trouble in the case of conventional motors.

The Muffin Fan is designed for continuous duty operation with a life expectancy of 3 to 5 years when operated within the ambient temperature limits of 40°F to 110°F and within the nameplate electrical rating of 105 to 120 volt AC, 60 cycles. It requires no maintenance and is lubricated for the entire life of the fan.

Since the stator and all electrical parts, including the two input terminal lugs are molded into a watertight shell, the fan is not subject to humidity damage and is, in fact, submergence proof.

When installed in a cabinet with the grille assembly in place and measured in accordance with NAFM code, the noise level is only 42 db on the A scale or about 10 db lower than the average present day room air conditioner.

---

laytector--
lonitors Radar

Miller Associates' Raytector monirs any radar system. It notifies inuntly—by audible or visual means or th—of the entrance of an object into search zone selected by the radar opator and it maintains a constant check the conditions of operation of the dar system and on its own operation. relieves the radar operator and ennces the dependability of search operations. Features—high sensitivity is achieved by a new means of greatly enhancing signal-to-noise ratio; zone of search is adjustable from 2 to 30 miles out with an adjustable width of 2 to 30 miles for a maximum zone operation reach of 60 miles; on early warning it will operate out to radar's full reach; produces its own range rings for easy selection of search zone; notifies operator of radar failure; notifies operator of Raytector failure; gives constant "magic eye" indication of top echo-to-noise efficiency adjustment. Dimensions: 1. 15½", h. 10½", d. 9-1/8"; weight: 30 lbs.; power: 115 volts, 60 cycles, 100 Va. Raytector produces a steady or repeated alarm signal; is easy to install, simple to operate and will not interfere with normal radar operation.

New Duplexer Has High Reject Attenuation

D. S. Kennedy & Co. has introduced a duplexer having a reject attenuation greater than 100 db and designed for operation in the 755 to 985 mc band. It is especially suited to tropospheric scatter applications. The duplexer enables the same antenna to be used simultaneously for both transmitting and receiving. It is made of high strength aluminum alloy. The transmitter and receiver ports are equipped with transitions which are fitted with coaxial inputs.

4-5 Digital Ohmmeters Give High Accuracy

Production of four and five-digit Digital Ohmmeters has been announced by Cubic Corp., San Diego electronics firm.

The new Ohmmeter, powered by Cubic Control Unit Model C-2, provides high accuracy on all ranges, Cubic says, plus or minus .01% and one digit for typical resistance measurements with the four-digit instrument for example.

Features include the incorporation of four input leads to avoid the effects of lead or contact resistance; an AC rejection filter which prevents induced

hum pickup; an open circuit test voltage of 10 volts maximum, which eliminates shock hazards and reduces resistor dissipation. Another feature, the addition of a resistor in the digital bridge, provides the instrument with the capability of calibration against standards up to 10% over full scale.

The firm says that only a small magnitude of current is drawn through the unknown resistance, because of unique bridge design and the incorporation of a highly sensitive null detector.

The Ohmmeter features Cubic's "controlled drive" stepping switches, with the switch turning off the drive circuit part way through the switch cycle, thus reducing the mechanical impact to a minimum and preventing the switches from being overdriven.

New Multifarious Core Storage Unit Is Versatile

A series of revolutionary random access data storage units is now available from Telemeter Magnetics, Inc., manufacturer of data equipment. These memory-buffer units offer addressable random access, sequential access, or a combination of both as desired.

Designated SERIES RB random access buffer units, they feature:

Variable input output—Will accept pulses or levels of either polarity and input may be changed during operation. Output is equally versatile. Accepts and emits single-ended or double-ended information. Environment—Reliable operation between 0° and 55°C, unaffected by humidity. High speed—200 kc operating rate. Long term reliability—Solid state active elements conservative derating of components advanced design and manufacturing techniques. Wide range of capacities—from 256 to 1024 words of from 4 to 20 bits per word. Random or sequential access—Addressable storage registers for regenerative read/write or buffer operation in a sequential nonregenerative mode. Binary or decimal—Either binary or binary coded decimal addressing.

Cathode Ray Tubes Have Ultra-High Resolution

The CBS-Hytron cathode ray tubes, primarily ultra-high resolution read out tubes or monitors, are designed for high precision display and photographic use. They are capable of resolving 2000 lines per inch. For a line scan of 4.5 inches in a 5 inch diameter tube, a total of 8000 lines can be achieved.

By the immersion electron optical design, the beam is controlled over its entire post-acceleration path. The half-deflection angle of 9.5° insures accurate deflection linearity with suitable yokes. Defocusing at the edge of the usable screen is less than 2.5%, but may be corrected to near zero by simple dynamic focusing. Some loss of resolution will occur at the extremes of deflection.

Tubes are available with P5 or P11 phosphore. These CR tubes are particularly suitable for photographic recording since the peak wavelengths of the phosphor fall within the blue region of the spectrum (4300A° and 4600A° respectively).

Tubes are also available in P16 phosphore. P16 has a shorter persistence of 1γs permitting use of these tubes in flying spot scanner work.

Transmitter Is Designed for Space Satellites

An all-transistor 20 megacycle telemetering transmitter, designed for possible use in space satellites, and built by Philco Corp. for the U.S. Army is the first U.S. satellite transmitter to operate in the 20 mc band and it has the same type of modulation used by standard radio stations and amateur radio operators. It also has more power output and is more efficient than the transistorized transmitters used in present U.S. satellites.

Developed by Philco's Research division for the Army Ordnance Missile Command, the satellite transmitter weighs less than 10 ounces, is five inches in diameter and one inch high.

New Philco high frequency power transistors made it possible to build this telemetering transmitter which provides up to one watt of output power. This is in contrast to one-to-two hundredths of a watt of output from transistorized transmitters in present U.S. satellites.

These power transistors, developed especially for the 20 mc transmitter by Philco's Lansdale Tube division, are used instead of bulky vacuum tubes which require large batteries of short life span.

Another transistor advantage is that nearly one half of the power taken from a satellite's batteries, which operate the transmitter, is radiated as radio frequency energy. This is important since electrical power is limited and precious in an orbiting space satellite.

The Philco satellite transmitter is capable of operating at high efficiency in outer space within a temperature range of 5 to 187 degrees Fahrenheit. —It consists of three sections:

Oscillator—Uses one Philco high frequency power transistor in crystal controlled oscillator circuit.

Power Amplifier—Uses four Philco high frequency power transistors in parallel. Power gain of amplifier is 8 to 10 db.

Modulator—Uses one Philco transistor as audio amplifier-driver and two transistors in Class B push-pull. Power gain of the modulator is in excess of 50 db. Modulation is applied to the collector of the RF amplifier.

Performance—Power output is about 600 milliwatts unmodulated carrier; 830 milliwatts with full modulation (nominal operating conditions).

Fill in No. 148 on Subscriber Service Card.

Oscillators for Missile Systems Are Pretuned

M F Electronics Co.'s series 101 and 102 fixed frequency RC pretuned sine wave oscillators are available in standard telemetering and decimal frequencies as stock items.

Oscillators are delivered from the factory set for the desired frequency; no external adjustments are required, thus reducing possibilities for misadjustment in final equipment. They become operative upon application of only one DC voltage (12 volts or 28 volts).

Resistance to mechanical shock and humidity is achieved by epoxy resin filling and the complete unit is hermetically sealed; oscillators may be operated under water. They are built in drawn metal cans of approximately 1½ cubic inches and may be conveniently mounted with two side flanges.

The 101 is distinguished from the 102 Series by difference in the frequency tolerance. The 101 has a total accuracy of ±5%, while the 102 has a total accuracy of ±2%. All oscillators are characterized by low distortion. Stability and functionality have been the two key factors in their development. Mechanical description: case-drawn steel, hot tin dipped; terminals-hermetic seal solder pin or hermetic noval connector; potting-epoxy resin; weight-35 grams nominal; storage temperature-minus 40 to plus 75°C.; operating temperature-minus 29 to plus 60°C.

The purpose of the packaged oscillator is to provide a reliable and stable frequency source, thereby allowing the systems designer to work with a black box with known performance.

Although rated for either 12 or 28 VDC, the 101 and 102 Series are operable with the wide range of supply voltages which might be expected during a typical battery life. With a nominal 12 volt source, the 101 or 102 should be chosen, while the 101A and 102A are intended for use with aircraft battery voltages of from 24 to 32 volts.

Oscillators will find their greatest use in aircraft, space vehicle and portable ground equipment. Typical applications include: telemetry, balloons, water vessels, missiles, guidance systems, timing circuits, bridge circuits, and test equipment.

INFRA·RED

BAUSCH & LOMB OPTICAL COMPANY · ROCHESTER 2, NEW YORK

Would you like to be kept informed on progress in infra-red as it occurs at engineering levels? This could be mighty useful in helping you evaluate developments that might well affect your own associated projects. That's the reason for progress reports we're sending out. Why not let us send them to you, also?

The reports will cover information on infra-red items that we feel can prove of value to you - how new calcium aluminate glass simplifies design of transmittance systems; how unique films set new standards of sensitivity in analytical discrimination - and much, much more.

And these aren't just laboratory samples we're going to be talking about. Our infra-red components have been proved in current operational missiles and are being supplied in production volume.

We're doing a lot of interesting work with infra-red materials---from research to performance-tested hardware. Why not fill out the coupon? We're pretty sure we can tell you something that's worth knowing.

BAUSCH & LOMB

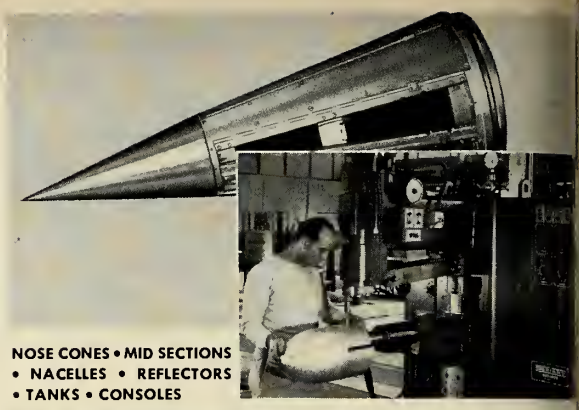
MATERIALS AND METALS

The chemicals, metals, and other materials from which missiles are made. This includes the processes which form these materials into the various parts of the missile.

LAVELLE

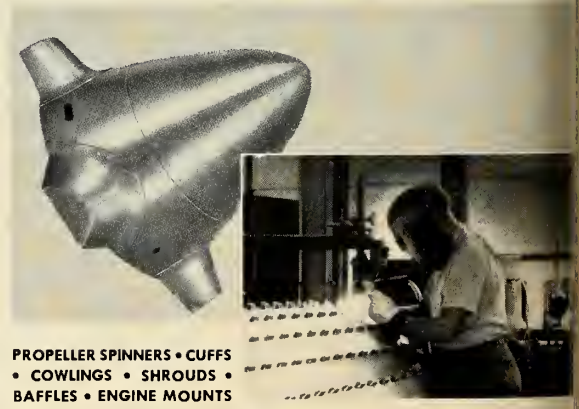


SPECIALISTS IN ROCKET, MISSILE, JET ENGINE, AIRFRAME AND ELECTRONIC COMPONENT FABRICATION

Sheet metal parts and assemblies precision welded, machined, and processed to your specifications by certified men, methods and machines . . . of stainless steel, titanium, aluminum, and heat resistant, high strength nickel alloys.

Weldments fabricated by resistance, inert gas shielded arc, metallic arc and oxyacetylene welding. X-ray, Zyglo and Magnaflux methods of non-destructive inspection are used to establish and control weld quality.

Services include engineering, production planning, tool making, sheet metal fabricating facilities, machine shop, anodizing, painting and quality control.



For components requiring precision fabrication, quality workmanship, dependable delivery . . . at reasonable cost . . . contact Lavelle.

RODUCTION FURNACE IS INTERNALLY HEATED

High Vacuum Equipment Corp. 3000 Series furnaces are internally ated vacuum or controlled atmos- ere furnaces capable of continuous eration at 3000F at a vacuum of 10^{-5}mm Hg or less, or for operation h an inert gas at 2500F. Four (4) dels are available with any one of following three (3) uniform hot nes: 4x8, 6x12, or 6x24 inches, de- ting diameter and length. respec- ely.

The basic unit (Model 1) com- ses a standard 660 or 1800 cfm ckaged pumping system, with the d wall vacuum furnace installed on . Furnace is water jacketed and con- s of a stainless steel inner shell and outer stainless steel water jacket. e furnace elements are made of vy molybdenum rod; the furnace t shields are made of molybdenum l stainless steel. Automatic tempera- e control is achieved by means of a urable core reactor, available with er an indicating or recording con- ller. A hearth is provided for sup- ting the work load. A door with or sight port is provided at one end f access to the working zone.

Necessary ports and fittings are in- ded in the basic unit so that it can converted in the future to any of other three models.

Model 2 is identical to the basic t with the addition of an externally unted, water-cooled heat exchanger l blower to provide extremely fast ling rates using inert atmosphere. s arrangement has the advantages of wing the work load to remain sta- ary and permit fastening thermo- ples directly to the work.

Model 3 is identical to the basic unit with the addition of a cooling zone and a water-cooled gate valve between furnace and cooling zone. Separate cooling zone permits vacuum and temperature to be maintained continually within the furnace since work may be loaded or unloaded using the cold zone as a 'vacuum lock' without breaking the furnace to atmosphere. This type system provides the fastest heating rates.

Model 4 is also identical to the basic unit except for the addition of a high vacuum gate valve and cooling zone with integral quench chamber. A variety of quench oils may be utilized to achieve desired heat treatment properties.

Models 3 and 4 are equipped with separate vacuum manifold and valve for independent evacuation of the chamber—thus, equalizing the vacuum between furnace and cold zone for semi-continuous operation. Both models contain a sliding seal in cooling chamber door to allow manipulation of a charging mechanism.

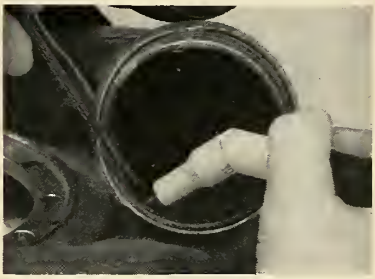
w Power Rollers ature Magnetic Brake

A new series of six power-operated rers with cam actuated idler roll and gnetic brake to prevent overcoasting ha been introduced by O'Neil-Irwin g. Co., makers of Di-Acro Precision alworking Machines.

Called Di-Acro Power Roller, each del features a magnetic brake which vides a positive stop enabling the rator to work to a scribed or hair lir without having to try and com- sate for the rolls coasting. Accord- in to the company, direction of the ro can be switched backward, for- wa or stopped at anytime by tripping a ot control.

Perfect circles of any diameter larger than two inches can be formed in sheet material in just two passes through the rolls due to the cam actuated idler roll. Bends can be located at any point in sheet material with straight sections on one or both sides. This also enables quantities of parts to be accurately duplicated as the idler roll is always returned by the lower cam to its preset position.

Di-Acro Power Rollers are available in models with 12", 18", 30", 36" and 42" forming widths. Each model has a power unit with enclosed housing mounted to the side frame of the machine and connected directly to the upper and lower rollers through a series of machine cut gears.



All forming rolls are ground and polished, the company said. Welded steel base extends the full length of the machine for permanent alignment of housing, bearings and rolls.

Standard equipment includes: calibrated rear roll indicators that enable the operator to adjust quickly the idler roll to a previous setting saving the time of rechecking the material for spring back; movable foot control, motor and all electrical equipment.

Arc Welding Torch Is Compact, Lightweight

The Wilson Equipment Corp., of Paterson, N.J., has developed an inert gas shielded arc welding torch that is extremely compact and lightweight. This torch is aircooled, weighs 2¾ ozs. and handles currents from 5 to 150 amps. The overall head length of the angle torch (also available in straight model) is 1¾" with gas cup installed.

Durability is achieved by the use of laminated glass cloth and silicone resin to insulate the head. This material will neither char nor soften.

The lightweight cable remains flexible in all working temperatures, considerably reducing operator fatigue.

Swayne, Robinson & Co. Improves Casting

Swayne, Robinson & Co. announces the development of a process for producing molds for castings by the new CO_2 molding method. This new method is particularly suited for castings designed for ultimate cost reduction through the elimination of machining.

Key to success in the process, according to the company, is proper sand mix. Considerable tests were made to determine proper balance of sand, binder and release agent to produce castings with exceptional fidelity of detail.

Gassing of the mold, the firm stated, is generally more efficient and economical than the shell method of baking since molds are cured in a cold state. Also, there is less chance of dimensional change due to uneven cool in sections of varying thickness as in shell mold baking.

Subminiature Tool Makes Wire Wrapping Easy

The difficult problem of connecting wires to subminiature tube sockets and transistor sockets can be made easy with the subminiature wire wrapping tool manufactured by Winkler Laboratories. The tool makes secure electrical and mechanical connections.

The operation is extremely fast, very simple, and almost obvious. It takes three simple steps.

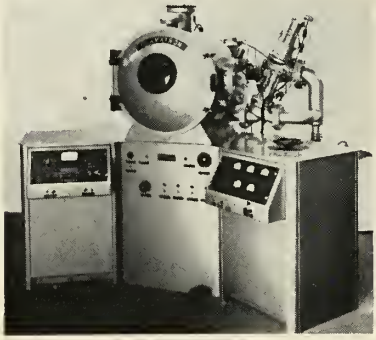
1. The end of the wire to be wrapped is inserted in the off-center hole of the tool.

2. The center hole of the tool is placed over the socket terminal to provide mechanical alignment.

3. The tool is spun with the fingers, wrapping the wire around the terminal.

During the wrapping, the wire is drawn out of the off-center hold. The rib on the end of the tool wraps the end of the wire neatly against the terminal; it is shaped to prevent snagging at the start of the wrapping operation. As the wrapping progresses, the tool is allowed to push itself away from the terminal. After wrapping, the connections may be soldered easily.

The difficulty of connecting wires to subminiature sockets has undoubtedly influenced other alternatives such as using printed circuit techniques and wiring tubes and transistors directly into the circuit. There is neither strength nor room to wrap size 22 awg (0.025 in. diameter) wire around terminals which are approximately 0.017 in. thick by 0.035 in. wide and spaced 0.096 in. center to center. It might be better to wrap the terminal around the wire. The practice of mounting components directly to subminiature socket terminals is similarly impractical; half watt resistors have size 20 (0.032 in. diameter) leads. For good joints, here are the important considerations.



The conductor must be consistent in size with the terminal and its spacing. This can be accomplished if 28 awg wire is used. Under no circumstances should wire larger than size 26 be used.

Some acceptable means must be available to secure mechanically the wire to the terminal.

Production Welder Uses High Velocity Electrons

High Vacuum Equipment Corp., manufacturer of vacuum processing equipment, has introduced a production welder utilizing the concentrated energy of a focused beam of high velocity electrons to weld metals.

These new welders, termed BEAMATRON will be used to weld those high temperature reactive metals and super-alloys important in today's nuclear, electronic and missile hardware. They are capable of welding metals ranging from aluminum to zirconium. By this process, it is possible to weld tungsten, tantalum or molybdenum to each other or to other metals, with results unobtainable by previously known methods.

The use of electrons in welding is possible only in a high vacuum, hence the union of electronic and vacuum techniques to produce a new welding process.

BEAMATRON equipment is effective in applications involving metals which react unfavorably with minute amounts of oxygen, nitrogen or hydrogen. It is a notable improvement over other welding processes such as the dry-box or shielded arc. Operation in high vacuum provides the most inert atmosphere—an atmosphere many times more pure than the best commercially available inert gases. Because most impurities trapped in metal become volatile in the high operating vacuum of the BEAMATRON, the entire weld zone, not just the surface is purified. The net result is a weld joint with physical properties and life expectancies which cannot be obtained by other means. At the same time the unit cost of such items as nuclear fuel jackets and electronic parts is reduced by the elimination of costly shielding atmospheres and the reduction of rejects.

Uniweld Process Offered for Space Vehicles

Menasco Manfacturing Co. has successfully applied its Uniweld process to extremely light weight spherical and cylindrical pressure vessels for space age vehicles.

Qualification testing to rigid customer specifications have been completed on several sizes of vessels constructed of both titanium alloy and high heat treat steels. Among the most unique of these is a cylindrical tank believed to be the largest yet made in titanium alloy. Approximately 9 inches in length and 14 inches in diameter, it contains liquid helium at 3,900 pounds per square inch pressure and yet weighs only 275 pounds.

While Menasco has produced over 6,000 missile pressure vessels, these new vessels represent the first application of Uniweld to tanks utilizing the latest in high strength, low weight materials. The consistent high strength of the Uniwelds, made under completely automatic machine control, also allows the company to offer a vessel with the maximum in reliability factor which is so extremely important in the space travel industry.

MISSILE
PURCHASING
DIRECTORY

Complete facilities are under one roof

Machine shop. turret lathes. engine lathes

Bore-Matics. milling machines. drill presses

Grinding. hobbing. shaping. broaching machines

Every machined part is inspected

Stator and rotor fabricating shop

EEMCO

QUALITY CONTROL...

begins with this modern, up-to-date plant in Los Angeles, California. • As a specialist in the production of actuators, motors and generators for aircraft and missiles, every step in their manufacture is subjected to the most thorough testing for extreme precision. • EEMCO products have been noted for their reliability for more than 17 years. You can depend on EEMCO quality.

ELECTRICAL ENGINEERING & MANUFACTURING CORP.

4612 West Jefferson Boulevard, Los Angeles 16, California — Telephone REpublic 3-0151

Designers and Producers of High Precision Motors, Actuators, and Related Equipment . . . Exclusively!

Motor, clutch, generator assembly

Actuator and gear box assembly shop

Winding armatures, fields, 400 cycle stators

Every production unit is functionally tested

Safety wire, masking and paint room

Packing and shipping department

MISSILE PURCHASING DIRECTORY

Below are listed over 3,500 companies engaged in the missile business, along with their address, phone number, and key purchasing and sales personnel. Information concerning type of company activity may be determined by the coding at the end of each listing. Codings are explained in the lower right hand corner of every other page. The editors have made every effort to obtain listings for *all* companies active in the missile industry, but in an undertaking such as this, there are bound to be omissions. If we have omitted anyone who should have been included, we are sorry—and hope that our readers will inform us for correction in future editions. Write to: Editor, MISSILE MARKET & PRODUCT GUIDE, American Aviation Publications, 1001 Vermont Ave., N.W., Washington, D.C.

Look for these . . .

high-interest special issues

during the next twelve months

1. July 20, 1959—Engineering Progress Issue

With special emphasis on advances in skill, this all important issue is a round-up of data and progress reports, featuring the Guided Missile Encyclopedia.

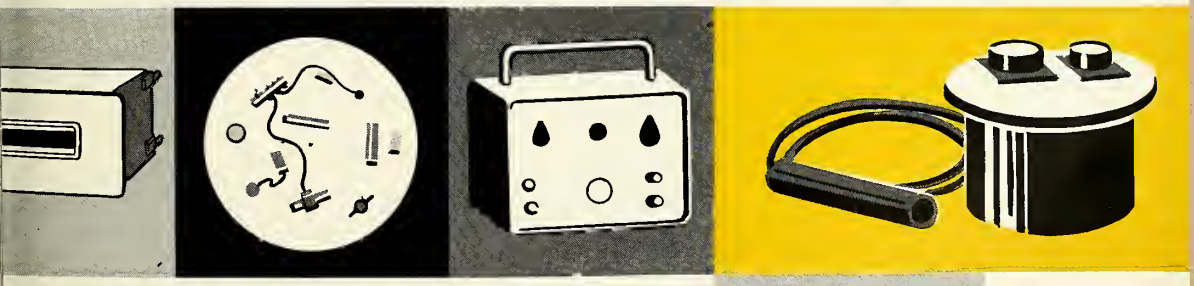
2. Sept. 21, 1959—Missile Support Issue

Breadth and scope of the missile market's fastest growing segment will be the subject matter . . . Covering complexities, needs and developments estimated to total almost 40 billion dollars in the next seven years.

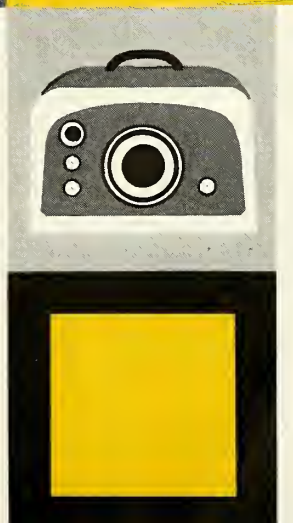
3. Feb. 29, 1960—Electronics and Guidance Issue

Putting the spotlight on an all important part of the missile industry, articles featuring subjects from lunar and interplanetary probe instrumentation to present and future aspects of inertial guidance make this one of the year's most important issues.

4. May 1960—Annual Missile and Product Guide



Sources of supply, industry capability, products, and manufacturers' index make this M/R special the most praised and handiest reference book in the industry. A must for anyone involved in missile or space flight work.



technical/news weekly of the missile/space industries

for advertisement on next page.

CLOSED LOOP SERVO REGULATOR

PRESSURIZES MISSILE PROPELLANT TANKS

NOTE THESE CHARACTERISTICS

- INLET PRESSURES FROM 3000 TO 300 P.S.I.G.
- OUTLET PRESSURE RANGE FROM 12 TO 75 P.S.I.G.
- TOLERANCE ± 0.5 P.S.I.G.
- WITHSTANDS SEVERE MISSILE FLIGHT ENVIRONMENT
- CONTROLS HELIUM, NITROGEN OR AIR.
- CONTAINS INTEGRAL SOLENOID SHUT-OFF VALVE.

Please discuss your requirements with our engineers
